I would guess that the problem is with the MegaSTe, not the Spectre. I have
AdSpeed in my Mega 4 and all works fine with the Cache on. Stuffit Deluxe works
fine too.

ME AGAIN. This was in response to someone mentioning that there was a program
out there that would convert between Outline Art format and some other format.
For some reason the editor here occasionally loses some of the information, as
it did in this case. Sorry!

OK, third times a charm. I don't know what happened to my other post, it got
really scrambled and lost lots of information. I'm looking for any, all, and
the complete information (Telephone#, Address etc.) for Didot Lineart.
Thanks!

This could be related to the problem that Spectre 3.0 has with the AdSpeed accelerator. Simply put the Spectre GCR would not boot in 16Mhz mode, but would work fine in 8Mhz mode. I contacted Gadgets by Small and was informed that they were aware of the problem and to install a toggle switch to the AdSpeed and manually switch into 16Mhz mode AFTER booting into Mac mode. It works perfectly. Gadgets says the problem will be fixed in V3.1.
This may or may not be related to the problem you're experiencing booting into Mac Mode with the Mega STE accelerator turned on.

> to work from the desktop.. (Parameters..) Anyway, if I simply type the
> filename of the C program I want compiled with cc.ttp by

First off, just a suggestion -- get gulam from atari.archive and try using it with Sozobon. It's a fairly nice shell and I can say from experience that it works with Sozobon well. It also hashes all the programs in your path so that you can type 'cc' instead of 'cc.ttp' and have the compiler driver execute quite nicely.

One other problem I had was a habit of leaving a trailing `\` in the pathnames defined in the environment variable PATH, which 'cc' choked on.

Of course, if you don't know what the **** I'm talking about, get gulam first and then go through this after looking at the gulam documentation. It's in /atari/cli/gulam.arc and gulamdoc.arc (I think).

> I get a "File suffix:"program.c" not known....

This is strange. I'd blame this on your shell at this point, especially when adding a " character changes the behaviour in random cases. If from gulam you typed 'cc program.c' things should go without a hitch.

> The problem is, for some reason the compiler doesn't recognize some functions,
> even though I remember to include the header file... for example, if
> I #include <stdio.h> and #include <osbind.h> I get an undef _Random and
> undef _abs.... (I am using the functions in the program..)

First off, I'd stick with rand() instead of trying to use the Xbios binding. It's much more portable. srand() is also provided, although for the default rand() implementation does nothing.

I'm not sure where abs() is defined, though if you had gulam you could 'cd sozobon\include ; grep abs *.h'. Once finding the macro definition you could #include the header file it appears in as well.

Also, have you printed out the dLibs manual? This is very important since Sozobon uses this as its default library, and the documentation to it is very clear on what header files must be #included to use certain portions of the library, and which functions are actually macros and where those macros are declared. dLibs and associated documentation should be in /atari/programming/dlibs??.arc (where ?? is the version number).

> I checked through the osbind header file, and Random is definitely defined
> as xbios(17).. I am not sure about abs, so I went ahead and included
> math.h, but that didn't work either! Sozobon C has to be more complete
> than that... I know it is!

Of course, I'm still not sure why Random isn't being defined. I don't have the header file here to look at and you didn't post a code fragment in case the mistake was your own. If you really want to use Random try posting a little bit of the offensive code, and I might have at least a guess.

> Please tell me what I am doing wrong... I am not used to using a cli, but
> I have no idea how to use cc.ttp with the desktop thing...

Well, getting the compile process to work is the first step. Learning gulam before C might seem to be complicating the issue, but believe me the effort put into getting a good shell that lets the compiler process run is worth it. You want to be learning C, not beating your cli into submission.

Once you have that down, if you don't have the docs to dLibs, get them!!! Even if you are typing in from a book (or doing as I am now, and trying to convert Unix sources) knowing when the original programmer made an assumption that just isn't so is important.

Also, if the author divides his source between Megamax, Mark Williams and Alcyon, try going with the Alcyon first.

Last thing is get szadb, which appeared in the newgroups recently and might hopefully show up in atari.archive as well. The debugger's ability to dump it's stack is worth the price alone ;-).

As for the 'desktop thing', forget about it. You do not want to edit and compile etc., without the benefit of a shell. You need to be able to write scripts and use history substitutions at the very least, so that you don't need to type in the arguments to cc.ttp every time the compile process chokes.

> Marc A. Lombardo

brad

ps. This might seem like an awful lot to do, but believe me the benefit of having a flawless shell/compiler environment is worth it. It's just too frustrating to be trying to learn C in the environment you're describing.

1459. Atari ST for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-07-22 16:57:50 UTC
From: hindi@eniac.seas.upenn.edu
Message-ID: <46658@netnews.upenn.edu>
Source record: 230185
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have the following computer system for sale:

Hardware

Atari 1040 STfm CPU with 1 Megabyte of memory, built-in 3.5" double-sided disk drive, RF modulator (for hooking computer up to a TV), RF cable, parallel printer port, serial modem port, DMA hard disk port, external disk drive port, cartridge port, power cable, about 1 1/2 year old. In PERFECT CONDITION, CASE NEVER OPENED, NEVER TINKERED WITH.

Atari SC1224 RGB color monitor, volume control, speaker works fine. Picture is beautiful, no flaws or burn-ins, includes power cable and monitor cable.

Atari mouse, two buttons, works perfectly.

Epyx joystick, the kind molded to fit into your hand, VERY responsive, two buttons, works perfectly.

Winner joystick, two buttons on base and one on top of joystick, works works perfectly.

(2) Atari brand joysticks, standard issue with Atari 2600, good for games that take a beating on the joysticks. Both work fine.

Extension cable for mouse or joystick, about four feet long.

Plastic matching covers for computer and monitor, off-white color.

Monitor stand, swivels up and down and turns left and right.

Mouse pad, brown color, no stains or rips.

ORIGINAL WARRANTY CARDS, original boxes, and original manuals for Atari 1040STfm, SC1224, and mouse.

Software

Title: Description:

Dungeon Master EXCELLENT D&D type graphic adventure, one of the best.
Falcon Air combat simulator, has digitized sounds, VERY GOOD.
Defender of the Crown Based on the legend of medieval Britain, like Risk.
TangleWood Off-the-wall type adventure, very strange, fun.
Grid-Iron Footbal simulator, good graphics.
Shuttle Space Shuttle simulator, fun for space-buffs.

ST-Talk Telecommunications program, easy to use.
QuickTran Utilites that compress files on sending end and expand
on receiving end to speed up file transfers.

FaSt Collection of utilites, caches to speed up the ST.
Pro-Copy 1.5 THE BEST copying software program there is!
Haba CheckMinder Allows you to keep your checking account on computer.
BackPack Cartridge that contains alarm clock, calendar, diary,
other useful utilities.

Regent Word Standard word processor, easy to use (no manual).

VIP Professional Excellent spreadsheet program, like Lotus (no manual).

PrintMaster Plus Makes greeting cards, banners, signs, exactly like
Print Shop.

ST X-Press Diskmate Came with magazines, contain useful utilites.
Vol 2, #3
Vol 2, #5
Vol 2, #7

ALL of the software are original disks and contain documentation
(except where noted).

Box of 10 blank double-sided 3.5" disks with hard-plastic disk container.

Plastic disk box with lock and key. (holds about 40 3.5" disks)

This is a COMPLETE package: computer, covers, joysticks, games, word processor,
spreadsheet program, telecommunications program, blank disks, and disk box.

My asking price for ALL of the above (hardware and software) is $450 or best
offer.

>"Alas sais na naman, oras ng pagdidili-dili...
> Isaisip ang mabuti, ang masama'y iwaksi..."

Diamond Back II does an actual Spectre partition image dump. Though it would have been convenient to perform an actual Mac disk backup, the image dump is not all that bad. It only dumps data that is on a particular partition and not the whole partiton itself.

|>
|>The exact message in the alert box shows:
|>
|> "Drive A does not exist", when clicking on drive A.
|>(or "drive B...", when clicking on drive B).

This sounds very much like a problem that I have with my STe setup (not mega STE). I think the problem is actually not with the STe but with the Segate HD mechanism I have mind you I have never tried to boot on a none STe system so who knows.

My exact setup is STe 2megs, ICD host adapter, 65Meg segate 5 1/4 drive (ST277N-1).

I thought this a little strange so tried another ST277N-1 with the same results. It looks to me that the ST277N-1 will recognise the boot request even if it is not fully ready and imediatly respond to it.

My work arround consisted of writing a small auto folder prog that runs first. This simply checks for the existance of drive a and if it isn't there then do a reboot untill it finds a drive A.

Note, my friends almost exactly the same setup except the ST277N-1 is a 3 1/2 inch ST177N does not have these problems but requires several boots before the HD is recognised as it may not be up to speed so he uses a floopy which contains only coldboot.prg in the auto folder. I believe this is the norm for how ST's work with HD's and has been discussed many times. I actually prefer the behaviour of my system as I can be boot in a short time without a floppy present.

Unfortunatly I accidently deleted the .prg I used while shuffling files on my disk and don't have a backup but will rewite it as soon as possible.

|>
|>After one or two cold-boots the drives are back again, and
|>the computer behaves with no problem at all.

If it is the same problem as mine you will find that if the drive has spun up fully one reset is sufficient to solve the problem, well it allways has been for me.

|>
|>I sometimes do boot the system without a floppy drive in the
|>drive and other times with a floppy in the drive. But up till

|>now-), I only had this, when starting with an empty drive.
|>But I'm not sure if this had anything to do with it.

I must admit I alway boot with no floppy in the drive so I don't know
on this one.

Erm, the "New Look ST User" is the one which has been on the shelves for
the last six months. It's marginally less crap than it used to be now that
the old ST World crew write for it, but it's still pretty dire.

Or is there a NEW new-look ST User?

Source record: 230193

A friend of mine had a CMI board installed in his 520ST some time ago (before IB Computers "repaired" it into death--but that's another story). He had the "Fast ROM" option, in which the ST accessed ROMs at 16 MHz, making for a *very* noticeable improvement in many OS/screen update/FD/etc. related areas. Of course, this option probably only works for TOS < 1.6, but it was a very interesting idea. Of course, it also allowed you to use a 68881, BLiTTER, etc. in an otherwise non-upgradeable machine. If I had an older ST, I'd certainly consider getting one of these boards to hack around with. He didn't have a HD, so I can't say anything on that point, but from what I observed, it was a reasonably stable accelerator.

Message-ID: <1991Jul23.033028.16043@cs.sfu.ca>
Source record: 230195

As promised, a summary from my quest for a word processor.

Thank you to David Butler, Steve Jacobs, Don Petcher, and several others whose mail I destroyed inadvertantly.

I had one recommendation for WordUp 3.0, but it came with the sad news that NeoCept has gone the way of the dodo. Is this so?

Several people recommended Word Flair. I can't seem to find it anywhere. Is there a demo I could check out or an address for the publisher?

Also there are rumours of WordPerfect version 5. Of course there have been such rumours for several years now, so I'm a little suspicous.

Did I miss anything important?

My ST just died. I never had any real problems before. It was just sitting there and then bam... Buncha bombs.. So, I turned it off and back on.. No use, it will come up and give me more bombs, some times it will keep resetting itself. The screen comes up garbled. My guess is my Power Supply is gone, is this typical for a bad power-supply? The supply voltages read ok: approx 4.9x and 12.x volts. My main question is, how many watts are these supplies? I would like to just go out and get a (read cheaper than atari replacement) supply, but I'm not sure how much juice I need. I have disconnected everything from the computer, so it is not my hard-drive or anything. Well, anybody got any tips? This is just my luck.. I have a SyQuest and a Spectre GCR in the mail and I need my computer for school-work (I'm typing on the old 8-bit now). Oh, yah, the number of bombs is not always the same... Real flakey. It is strange cuz it was just sitting there, working fine... uhg....

From: jimomura@lsuc.on.ca
Message-ID: <1991Jul23.045020.4988@lsuc.on.ca>
Source record: 230194

This last couple of weeks has been building to a very bad day today wherein mainly I sat around doing nothing in particular, taking my mind off my recent activities. It goes like this:

1st Priority Project:

This project was written with Sozobon C and I'm at a crucial stage. I want to port it to Lattice *now* before it progresses because I'm heading into a lot of stuff that's going to probably require a substantial rewrite if I port it later. I seem to have hit a genuine major compiler bug. I call it "major" because the compiler refuses to generate the linking file. Since the compiler designer felt it was that important a bug, I'm not going to argue about it. But at the point the bug occurs, I haven't done much in the program at all. It occurs in the very first module which doesn't do much more than declare the global variables and call a few fairly straight forward functions like "printf()". I've sent a bug report to the distributor and I'm awaiting a reply by mail. So what should I do with my most important project I have? Do I go back to Sozobon and continue it or let it sit?

The answer depends on what my "next priority" job is. That job was to develop something for the Portfolio. I eventually got PBASIC 4.5 and it looked like it would do the job. So I started, and guess what? I found a bug in the PBASIC interpreter. I don't have any other tools to develop for the Portfolio right now. I'm waiting for the mythical BASIC compiler. That sounds like a likely way to do what I want to do. I'm preparing a bug report, but I haven't decided whether to send the money (something like $40.00) for the manual and proceed with this project or wait for a compiler language to become available for the Portfolio. What to do? Push ahead or let it sit?

That depends on what my *next* highest priority job is. Well, this is a fresh program to be written in Lattice C. Now you might feel that I should write off this project immediately because of the problems noted above. But that's not necessarily the case. It may be that if I start a whole new project I'll be able to work it up slowly and maybe isolate and avoid the bug I was running into with the program above. Besides which, it means I have an opportunity to try the WERCS resource construction system they provided. So I started into this. WERCS works fairly well. I was pleased with most of the functions and I built what I expect is a very good menu system. WERCS creates a ".H" file to include. So I started writing the program. The program consists of a couple of "include" statements, a "return 0" at the and and a single function call reading the ".RSC" file into GEM system memory. Guess what? The first stages of the compiler worked.

But just to be safe I decided to compile all the way to an object file. The linker choked. It couldn't find a couple of referenced functions as far as I can tell. Nothing I found in the manual points to an obvious solution. I expect I'll go back and find the problem tomorrow. Surely it can't *really* be the compiler. Not *this* early in the development. I expect I'm probably using the wrong "stub" file. They provide a few. But if a specific "stub" is necessary just because I'm using a ".RSC", then I think they should have said so in the manual, in the description of the function call. I think it's either that or it has to do with the type of executable. The file created was a .TTP and I expect I should be making a .PRG.

Anyway, having dropped down 2 "priority levels" in my projects, I decided to rest a bit and think about what I'm going to do for the rest of the week. Go back to the top priority project? The 3rd priority project appears most likely to be solvable. Gee. Wouldn't it be funny if *none* of the tools I have are capable of doing *any* of these 3 jobs? Ah yes, the old "you can't get there from here" routine. Very funny indeed, right?

Anyway, just to take my mind off the above stuff, I thought I'd give Atari a hint about what I think should be on *their* priority list:

1. An upgrade kit for 1.44 Meg floppies for 1040STf's. It's surprising how much I can do with a 1040STf and 2 720K floppies. But I certainly could use the space if I could make do with roughly have the floppies that I currently have lying around.

2. A debugged TOS for the 1040STf. Surely by now, ...
The only real change I'd ask for is a new floppy driver that gets rid of the random serial number system which turned out not to have sufficient advantage to justify the danger of using it in an environment where people have true MS-DOS machines and want to be able to swap floppies freely without problems. Such a driver would, of course also be designed to support the 1.44 Meg floppies this time around.

Surprise! That's all I'll ask for. I'd be really happy to see more improvements in the Atari product line, Atari corporate policies and whatever, but if I only ask for this much, I think it would be reasonable if they give it serious consideration. It certainly doesn't sound impossible for the coming year.

Hay, wow this sounds like one of the common faults for early ST's. The quick solution is hit the machine well drop it from about 3inches onto a solid serface. Perhaps a little more explanation is in order. The earlyer ST's used lots of socketed chips and after a while the chips work a little loose, this causes some very flaky results much like the ones you are seeing. If the rough method of fixing unseated chips doesn't appeal (I don't think it does to me) then take the cover off the machine and simply press all the socketed back down.

1476. Multisynch and other monitors (Help!)

Newsgroup: comp.sys.atari.st
Date: 1991-07-23 18:56:06 UTC
From: snoret@unx.sas.com
Message-ID: <1991Jul23.185606.18946@unx.sas.com>
Source record: 230052

First of all, I want to say thanks to those of you kind enough to send replies to my Video Key inquiry. Your help is greatly appreciated!

Anyway... Does anyone have any (reasonable) suggestions, recommendations, tips, leads, etc. on a good multisynch or other compatible monitor for a 1040STf? I am on a budget, but I don't fancy the idea of two monitors in my tiny, cluttered home computing area.

Are gray-scale multisynchs any good? What makes and models offer the most reasonable compromises between quality and price? Since I have an Apollo DN3500 at work (only B+W, but great resolution), I'm not necessarily confined to color, but would like to have all three resolutions available to me. (But I'd like to have colors... I just would like to be able to retain ownership of my major limbs and organs :)

If this info has been posted in the past, or in FAQ, please forgive me. I'm still really new to the net, and until later next month, don't have ftp access to the archives. If you'd like, you can reply directly to my e-mail address, or to the net if it's worthwhile.

Thanks a whole helluva lot in advance!

Rick

1478. digittal sample playback question

Newsgroup: comp.sys.atari.st
Date: 1991-07-23 21:30:57 UTC
From: trux@beyond.caltech
Message-ID: <TRUX.91Jul23143057@beyond.caltech>
Source record: 230057

Hello ST community,
I wonder if anyone knows anything about how digitized sounds are played back on an Atari ST. I have a digitizer for my IBM which produces a file of size [4000 Bytes for each second of digitized sound]. I want to use these files with my ST. Each byte corresponds to one of 256 different voltage levels to be applied to an analog speaker. A large difference between two consecutive bytes produces a loud 'click' and a small difference produces a small click.

I tried playing a constant tone over the Atari's speaker and setting the volume (0..15) 4000 times per second, but this has 1/16th the resolution of my digitized sample and the replay quality is VERY poor.

I know that impressive digital replay is possible on the ST, any ideas how?

Thank you,

Some users reported that the Atari Twist help them. This is similar to the three inch drop, because you hold it about that high to do the twist, but it seems much more gentle to me.

Grip the case firmly at each end. Twist the right hand toward you and the Left hand away from you, flexing the case. Then reverse the directions. If the chips have not popped out, this flexing action might re-establish contact.

Or, if they aren't socketted, then you've probably got a dry joint that has
come loose. I guess a good eye and a soldering iron would be the tools then.

I doubt it has anything to do with the power supply. If you've got bombs, then
some OS is alive (they aren't hardware sprites :-]/:-[).

1484. MiNT library patchlevel 10 now available

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 03:37:11 UTC
From: ersmith@ria.ccs.uwo.ca
Message-ID: <3843@julian.uwo.ca>
Source record: 230059
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've uploaded the source code and binaries for the patchlevel 10 of
the MiNT library to atari.archive, in the mint directory. There are
a *lot* of changes from patchlevel 8; most are cosmetic (removing
various compiler warnings) but there are some significant bug fixes
as well.

Most notable of the fixed bugs was one in open(); the old version was
passing the "mode" argument unchanged to Fopen. This was a *very* bad
thing to do; in fact, only the lower 2 bits (O_RDWR, etc.) should
be passed. It doesn't matter (much) in the current version of MiNT,
but it could cause very severe problems in future versions of MiNT.
I would strongly suggest that you recompile all your MiNT programs
with the newer library (or at least with a fixed open()) so that
the transition to MiNT 0.9 won't be quite as painful :-(.

Other changes include drastic changes to the include files to handle
prototypes more easily, and to improve portability to other compilers.
I've also incorporated many of the changes to the "standard" gcc
library that Jwahar Bammi has been maintaining (thanks, bammi!).

APP files are basically the same thing as PRG files (you runthem the same,etc). Look at your DESKTOP.INF file, and notice that the line with *.PRG and the line with *.APP are virtually identical...

As for your TOS version, it probably is TOS 1.0. You could either upgrade to 1.4 (recommended) or I believe use the VENUS file instead of GEMINI (very similar, but I think with a couple options missing)...

I have written one that loads and plays simultaneously. I'm not sure
what the transfer rate is from floppy, but from harddisk it works a charm.
The Rhythm Nation sound files are great in succession. I guess you'd only
have to transfer 10K per second or so - floppies are that fast aren't they?

Also, it gives you the option of not calling them .snd files, but renaming
them to .<100HZ> files where eg., bell.80 would play at 8KHz. Of course,
you can ask it to play them at any speed with command-line options.

I will uploaded it to atari.archive as soon as the Holy Trinity is fullfilled
(I'm at home, No-one is on the phone, and I remember). Before I do, get in
quick and tell me anything else that should be added, considering it is NOT
a GEM application (is there a need for one?)

Ciao,
Warwick.

I couldn't agree with you more but who knows what a full merger will yeild?

|>Or is there a NEW new-look ST User?

Ar, I think it is due to change again. Games in a pull out section etc. One
thing I think they must do is get someone that knows the ST to answer to
write the Problem and letter paged, these pages are poorly written and often
simply incorrect.

Viola! I remembered - I've just uploaded it. Man page and all.

Called "mplay.arc" to avoid confusion with Dave's "play" program.

And yes, it does load and play well from floppies.

Enjoy,
Ciao,
Warwick.

The August copy says that the New new-look ST User will feature ST World
incorporated within its pages, so it will be another re-vamp.
Personally I object to the current new-look being written for 10 year olds
by (seemingly) 10 year olds - a picture of Bart Simpson on the front of a
recent edition says it all, I think.
Hopefully the writing style and coverage, will change for the better (and
elder!), but I guess not.
Still none of the ads. in it are mentioning Mega STEs for sale - anyone
in the UK got one yet, and if so, for how much?

Which make v. 3.59 are you using? The one from a.a? In mine I do
*not* have to specify the complete path, but only the .ttp file
extension:

TEX = latex.ttp

Otherwise, it and v. 3.54(?) would have trouble finding the file.

1494. HELP!!! with lharc

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 13:05:34 UTC
From: oconnor@vino.dec.com
Message-ID: <24886@shlump.lkg.dec.com>
Source record: 230070

Hi,

I'm not trying to start a falme war or anything but I need to know which lharc
will work with these 2 files:

cocktail.lzh
gods.lzh

I have lharc 0.51 it extracts the files and gives me one unamed file but no
real files. While running, it says each individual file exists but it does
appear to extract them. But when it is done I just get this one unnamed file.

Any ideas or someone who can tell me which version of lharc to use
would be most helpful and appreciated.

Thanks in advance.

Joe

1495. Word Perfect and fonts

Newsgroup: comp.sys.atari.st

Message-ID: <1991Jul24.134124.20465@rodan.acs.syr.edu>
Source record: 230071

I don't believe WP uses gdos fonts, so I was wondering if any
of the font manipulators out there will allow you to use
different fonts with WP for the ST? I'd even be interested if
a program allows you to replace the system font...as long as
WP doesn't simply override that and return to the original
system font when it loads.
Does anybody have any ideas?
Thanks,
Gerry

1497. Wanted: Digitizer for ST

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 15:44:27 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991Jul24.154427.19645@oz.plymouth.edu>
Source record: 230075

Hello,

I'm looking for a sound digitizer for the ST. I remember
a few years ago that there were a couple models which plug into the
cartridge port. I would like a mic jack as well as normal audio input
like from a CD player if that type of thing is available.

Please reply E-mail

Stephan

1498. DigiStuff (latest versions of digital sample utilities) available

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 15:54:19 UTC
From: dmb@wam.umd.edu
Message-ID: <1991Jul24.155419.29662@wam.umd.edu>
Source record: 230073

Well it's been over a year since I've updated the copies of Beep, Digitial Keyclick, Digivec, Play, etc. at atari.archive, so I've made a new archive which contains the latest versions of all these and more.

Here's an exerpt from the doc file that comes with it, FYI:

The accompanying self-extracting archive contains the following digitized sound utilities:

```
Program Ver. Function
------- ---- --------
Beep v1.5 Replace system beep with digital sample
Digital Keyclick v1.7 Replace keyclick with digital samples
Digivec v1.5 Trigger digital samples on system errors
QD Play v1.7 Play sounds from desktop or AUTO folder
st2hippo v1.2 Convert ST format sounds to Hippo format
hippo2st v1.2 Covnert Hippo format sounds to ST format
sparc2st v1.0 Convert SparcStation .au files to ST format
```

The most notable improvment in the AUTO folder programs is support for alternate D/A devices like the Hippo/Navarone and ST Replay digitizers. QD Play now has a -r option to play sounds in reverse. All of the utilities have been made much more robust since the first versions.

Note that all are FREE except for Digital Keyclick, which is SHAREWARE. If you like any of the programs, please send in the $15 registration fee for Digital Keyclick. See the Digital Keyclick doc file for info on what you'll get when you register. If you've already registered, thanks a bunch!

This should be available from atari.archive.umich.edu in the next few days. Look for it initially in atari/newitems/digistuf.arc, then later in atari/sound/players/digistuf.arc.

Please let me know if there are any problems.

Dave Baggett
dmb@wam.umd.edu

PS> If anyone would like to loan me an STe, I'll be more than happy to make these work with DMA sound! (A TT would be fine too.) :-/

>WP doesn't simply override that and return to the original
>system font when it loads.
>Does anybody have any ideas?

A couple of years ago I needed some special characters in a document I was working on. I tried replacing the system font using font.ttp, and also some accessory that does a similar trick (the name escapes me right now), but in each case WP just reverted to using the normal system font. I know that my new font was resident, because when I called up the Alt/Ctl key mapping screen, the table of characters at the bottom was displayed using the new font; but for some reason WP would only display the normal system font on the document screen.

I called WPCorp to find out whether they had hard-coded the address of the ROM character tables into the program, or whether the program uses its own built-in display font (which just happens to be identical to the system font). The ST Support person didn't want to tell me much (it seems that WPCorp takes a dim view of people hacking on their executables), but did finally hint that the program uses its own fonts. So I went searching through the program with a binary editor, thinking that I would find the character tables and modify them directly. But I wasn't able to locate them. :-(Truth to be told, I don't even know exactly what to look for.

If anyone has any suggestions I'd be forever grateful, as I'm sure would Gerry and others who would like to see some different characters in their WP documents.

Message-ID: <1991Jul24.171119.6427@ugle.unit.no>
Source record: 230076

Hello Everyone !

A friend of mine have an Atari 1040STE.
He has accidently formatted a floppy with some days work (he had no backup).
I wonder if there exists any opportunities to recover the data (as Norton Utilities etc.)

Please e-mail me answers..

Thanks !

Carl-Fredrik Soerensen (carlfred@idt.unit.no)

1501. Use Unlzh 1.72 for Unlzhing! Works with all!

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 17:46:19 UTC
From: Bryan_Jones_Woodworth@cup.portal.com
Message-ID: <44749@cup.portal.com>
Source record: 230084

I have heard ENOUGH! I don't see why everyone has problems with LZH and LHarc.. All you need to do is use UNLZH 1.72 and all your files will be unlzh'd easily and painlessly! It uses a nice GEM interface and I have had *no* problems with it.

I use DC Utilities' DC Xtract 2.0 to LZH files. Before I upload them, I

"test" the archive for errors. Once in a while the file fails the CRC check, but when it passes 95% of the time, I proceed to upload it.

If you do the above -- use UNLZH 1.72 to unlzh, then use a LZH'r which can test LZHives -- you will have no problems whatsoever. However, there is no way you can get around bad LZH files someone else may have uploaded. WE just need to encourage everyone to test their LZH'd files; otherwise, use ARC.
Here is how to get Unlzh 1.72 from Terminator:

(This is the description of the file):

>unlzh172.lzh 176 Unlharc version 1.72. I don't use this one. :).

YOU SHOULD :)

Request terminology:

send archivers/unlzh172.lzh

Enclosed in a message to: atari@atari.archive.umich.edu

sincerely, Bryan_Jones_Woodworth@cup.portal.com

1502. Lattice C -- Single Pass?

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 18:01:03 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jul24.180103.25979@lsuc.on.ca>
Source record: 230077

I got my first "do nothing" program to compile and link and waddling through a slow program development I started to run into problems. Then something occurred to me. I compiled the sample program (WTEST.C) that comes with Lattice C and it compiled, linked and ran perfectly. Then I moved the 'main()' from the bottom of the source code to my normal location just under the globals (the "top" of the program) and it failed to compile.

My best guess is that Lattice is a single pass compiler after all. I asked around before and was told it was multi-pass. But it's not something that some programmers would notice. At least not unless they try porting programs written by people who organize top down.

I called Goldleaf and the fellow I talked to didn't even know if it was single-pass or multi-pass. Maybe I didn't talk to their best compiler man. Anyway, he's going to look into it and call me back tomorrow. If this is true, then I think I'd call it a *major* deficiency in their documentation. It should have said so on Page 2 right under the title "What is Lattice C 5?" The very first sentence should have said that it's a single-pass compiler. If it's not a single pass compiler, then I seem to have found a serious bug. :-)

1503. Where to get PC-DITTO II PALs ??????

Newsgroup: comp.sys.atari.st
Date: 1991-07-24 18:43:36 UTC
From: george@electro.com
Message-ID: <1991Jul24.184336.3460@electro.com>
Source record: 230083
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I would like to buy my friend's PC-DITTO II from him
but... He has no PALS for it!!

He sent them away for the upgrade they offered but
they went belly up before he got the replacements.

Is there anyway to get these devices?
You can't copy them , cause the security fuse's are blown.

Has someone got a spare set?
Has someone got the PAL equations?
Has someone got a person to contact , formerly of PC-DITTO?

Help would be greatly appreciated.

Try to look at NT_COMP at atari.archive.umich.edu in the sound/player directory.
NT_COMP will load and play the file, but more interestingly there is source
to all kinds of player hardware, ROM port, Printer port, STe DMA and the good
old standard ST soundchip...

That is true, although the mono is a bit grainy on the two such units I have
seen. It has been posted that will a high grade Multisync this is not true,
but I have not seen this.

>
> My question is: Does it matter just what kind of Multisync monitor I
>get? I've seen some 2Ds as low as two hundred dollars-- would it workl with
>an Omniswitch?
>

Yes, it does matter. There are some specs that the monitor must meet. I
suggest that you call Toad Computers (1-800-544-6923) and ask them. They have
introduced a monitor-switchbox/multisync adaptor box themselves (in
this months issue of Current Notes) which costs $59 ($39 for monitor switching
only). They should know the specs you need.

I am in no way connected with Toad blah blah.

1512. GhostScript 2.2 available

Newsgroup: comp.sys.atari.st
Date: 1991-07-25 04:24:40 UTC
From: timothyg@ncsa.uiuc.edu
Message-ID: <1991Jul25.042440.4338@ux1.cso.uiuc.edu>
Source record: 230078

I uploaded the executable of GhostScript 2.2 for the Atari ST to atari.archive Monday evening. It should be available for downloading soon, probably in /atari/gnustuff/tos/ghstscrpt/gs22b.zoo. I am in the process of moving, so the sources won't be posted for a little while (maybe not until 2.3, which is due around the end of August).

GS 2.2 sports some bug fixes, a monochrome screen driver, and five printer drivers (only one of which is tested). Improved 2.2 fonts are available at other archive sites, but the old fonts seem to work fine with 2.2 if you want to delay another lengthy download. This release is a considerable improvment over 2.1.1 and I recommend it highly. With the new screen driver, you can use ghostscript interactively to learn postscript or test a small piece of PS code.

If anyone is interested, any email sent to me after August 15 1991 should be directed to:

Tim Gallivan
timg@landau.ph.utexas.edu

Well just pushing them down will work for a while but really just pushing them down is only a temporary fix at best...
There are a few things you can do to stop it...
#1, DO NOT smoke near the computer. (My dad doesnt listen to anyone and smokes at the computer... Every 2 years it has to be cleaned out. And I mean CLEANED OUT! You wouldnt believe how rough smoke is on connections and such..)
#2, Get some contact cleaner (Be careful cause SOME will eat plastic too.. You do not want that...)
#3, Pull all the socketed chips out one by one. (I place all the chips on my workbench in the same order they are onthe motherboard so I know where they go.)
#4, once all the chips are out you can spray the cleaner over the contacts. (Note, if you do not want to do it this way you can pull each chip out one by one, spray the socket and then put the chip back in but pulling all the chips is faster. And wastes less.) This cleaning disolves any oxidation and any smoke or other residues on the contacts.
#5, With the square chips you can sometimes loose contacts between the socket and the chip. (Tech specialties memory boards are good at causing this!)
To fix it you take a medium sized paper clip and unfold it by half. YOu make the big loop into a handle and you cut the small loop so it has very little of the loop. YOur gonna use it as a pry bar and pull the pins in the socket out slightly. (NOT too far, remember that bending metal back and forth is not a good idea. So the less you bend it the better.. You dont need to bend it much anyhow..
#6, Put all the chips back in in the proper orientation and your alset. I did this with my dads machine and my own as well as three other computers. None of them responded well to my pushing the chips down.. (Had to keep pushing them down all the time.. Once a week at the least..) Once I went through the procedure above with all the machines they worked perfectly and still are. (2+ years!)

I would suggest getting someone knowlegable to do it though..
(Note this message was really to the original poster but figured you could learn from this message too.. ;-))

>I have heard ENOUGH! I don't see why everyone has problems with LZH and
>LHarc.. All you need to do is use UNLZH 1.72 and all your files will be
>unlzh'd easily and painlessly! It uses a nice GEM interface and I have
>had *no* problems with it.

i'll tell u why: unless there is source code, i can't run it on a unix
box. and i do NOT want to download (at 2400 baud) a 500kB file before i
look at it. i admit to not checking if source was included. if it is,
which i doubt, then...never mind. oh, the source better be C, not assembler,
too. by telling me it has a gem interface, i can guess it is highly
non-portable.

it's real simple: if u think unlzh solves the world's problems, then post
source code (so we can port it) and we won't complain (too much... :-).
then after unpacking, we can "zoo" it like it should have been in the
first place :-).

Maybe there are more peple interested (like me). Please ost a short description.

> Since Optimized Systems Software (OSI) is no
> longer in business, does anyone still support this compiler?
> Can anyone direct me to the people in Germany who actually
> wrote this compiler?

As far as I know the complier was written by Joerg Lohse (currently working at the University of Hamburg). But I don't think he is involved in supporting the compiler any more.

The German distributor is:
CCD, K. Meyfeld, Schoene Aussicht 41, D-6229 Walluf, Germany.

I heard rumors that they might drop ST-Pascal. Details anyone ?

There arn't any! Not even for the smaller developers. I've been waiting for one
for about 2 months now and I'm a registered developer!

At least one good thing may come of it. We may not be the beta test site of the
world like we were when the STe came out so hopfully many of the mega
STe faults
will have been fixed by the time we finally get them here.

|>they try porting programs written by people who organize top down.
|>
```

No, It's a multi pass compiler but ANSI compatable. You have run into ANSI function prototyping. In ANSI C the compiler checks to see if you pass the correct values to functions in a simmilar manner to Pascal, thus if the function is not declaired by the time you come to use it you get errors. I allways write my programs in two file one a header file and the other a C file. The header file in included in any file that uses the function I have defined in the C file.

Example:

```
/* -------- FILE test.h -------- */

int addNumber(int,int); /* Just tell the compiler about */
void printString(const char*); /* The function definitions */

/* -------- FILE test.c -------- */

#include "test.h" /* Tells the compiler what the */
/* Function defs are. */
#include <stdio.h>

int addNumbers(int a, int b);
{
return(a+b);
};

void printString(const char* string)
{
printf("%s\n",string);
};
```

```
/* -------- FILE main.c -------- */

#include "test.h" /* again tell the compiler of */
/* the definitions. */

void main()
{
int a;
a = addNumbers(10,15);
printString("Hello I have just added some numbers");
}
```

OK, the above don't do anything except illurstrate function prototyping. You will have to compile the two c files and then link them. For fast development I would recomend useing a make utilitly (eg, GNU make) but the link control files that Lattice provides work OK.

The other less desirable solution to your dilemer is to set the compiler into K&R and turn off function prototypeing.

Moving main() to the `top' of your program means that, unless you give
declarations for the functions used by main(), they will be assumed to return
ints. Now, when the functions are actually encountered, and they return
something OTHER than ints, the compiler will barf. And quite rightly so (no
matter how many passes it makes). I also write my C programs with main() at the
`top', but I also religiously declare all the functions I'm going to use. It's
a good habit to get into ;-)

1520. Lynx info wanted

Newsgroup: comp.sys.atari.st
Date: 1991-07-25 10:23:43 UTC
From: martijn@cwi.nl
Message-ID: <3947@charon.cwi.nl>
Source record: 230101

Hi,

A couple of articles ago I saw something about the Lynx in this group.
Is there another group where I can find more about the Lynx, or is this
the group where Lynx-oriented articles appear?

Yesterday I bought a Lynx, and I am interested in the opinions on
existing games, especially the multi-player games. Before spending
money on games not worth it I'd like some feedback on what games are
worth their money. At a friend's place I saw two people play Slime World,
which is the main reason I bought the machine. Gauntlet looks promising
as well. Any other info around ???

Thanks!

Get a 3D, they can save the settings in NVRAM, then there is no need
to make ajustments each time you change resolutions.
from what I have read from otheres, get a 3D and you won't be
disappointed.
I don't think that the 2D will work with the ST, the frame rate of
the ST mono mode is 71.2 hz

APP files are identical, and you can simply rename them. The extension .APP
is usually used if the program needs or supports GDOS (which GEMINI does).

>file instead of GEMINI (very similar, but I think with a couple
>options missing)...
VENUS is only the Desktop part of GEMINI - the whole MUPFEL (command line
interface) is missing.

1525. supra clock

Newsgroup: comp.sys.atari.st
Date: 1991-07-25 12:11:48 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Jul25.121148.18021@actrix.gen.nz>
Source record: 230104

Can some one help me with the Supra Clock Problem,
this is the problem with the Clock Chip, Part No.
RCA CDP6818 or Motorola MC146818 draging down the battery.

I read some where that Supra was replacing faulty Clock chips.

But the real problem is that this clock chip uses to
much power 50ua max, from the RCA data book.

I did ring Supra to find out, but I was told that I
would have to send my Host Adapter back for them to replace
the Clock IC, with a Dallas one.

This was not just a plug in job, traces have to be cut, etc.
I asked them if they could give me the details,
so I could do it myself, I told them that I was a competent
Computer Engineer, no way and could not even give me the
Dallas clock chip part No.

So is there some one that can give me the Part No.
of the Dallas Clock Chip, and also if Possible some of
the changes that where made to use this device.

If I get the Dallas Part No. I can possibly work out the modifications
for myself, but will post the information here for otheres to carry out.

From what I can see in the Dallas data book, they make 99.9%
compatible MC146818 that have a 10 year life with the
built in battery, Part No. DS1287 and one with a external battery
Part No. DS1285/Q with a current drain of 100 time less than
the MC146818.

Note: I also found out that there software version 4.01, (latest)
does not support BGM partions.

Thanks, Roger..

>
>Can anyone give me info?

Simply start Gemini. It checks for the correct TOS version and tells you so, if you still have TOS 1.00.

>I have heard ENOUGH! I don't see why everyone has problems with LZH and
>LHarc.. All you need to do is use UNLZH 1.72 and all your files will be
>unlzh'd easily and painlessly! It uses a nice GEM interface and I have
>had *no* problems with it.

I have to agree with this, and I've said it before myself. I use unlzh 1.72 by John Harris to extract on the ST, Lharc 1.20 (1.30 as of last night) by Roger Burrows to LHarchive on the ST, and Lharc 0.03 (Beta) by Y. Tagawa to extract and Lharchive on Unix machines.

I upload and download tons of stuff and I've never had a problem. Not once. I believe that early incompatibility problems have been solved.

A few interesting things I've found about archivers in general:

o If you Arc an already-compressed file, Arc will fiddle around for a while and then say "Storing", which is most likely the correct thing to do. HOWEVER, it seems that if Arc changes its mind like this (from crunching to storing), the Arc file is * strangely large *. My recent DigiStuff posting is an example: I Arc'ed the self-extracting LZH file alled DIGISTUF.TOS and came up with an Arc file of about 250K. Then I forced "storing" by using "arc as ..." and the archive came out to be 215K. Perhaps Arc is storing CRC information in the first case but not in the latter? Still, it seems strange.
BTW, this is with Arc 6.02ST.

o Of all the LHArchivers, Roger Burrows' seems to make the smallest files. The Unix LHA 0.03 (Beta) makes files that are a tiny bit bigger (no surprise I guess), and * strangely * the otherwise excellent Lharc 113 from Thomas Quester makes .LZH files that are several K larger than their Burrows LHA counterparts, at least in the several cases I've tried. All three lharc programs can uncompress files made with each other, though, even though the compression factors are different.

o The new Zoo 2.1ST at least sometimes creates smaller files than even Lharc. Here are the results of a recent test I ran:

```
mrw------- 1 u 251231 update.zoo (hi)
mrw------- 1 u 283792 update.lzh
mrw------- 1 u 395288 update.zoo (normal)
mrw------- 1 u 418149 update.arc
```

```
mrw------- 1 u 1125376 update.tar
```

The tar file consisted of mostly C source files and DRI .o files. With "high compression" Zoo 2.1 achieved 78% compression. Burrows' Lharc 130 was close behind, but the other schemes seem much less effective. With "normal compression," however, Zoo gave its typically sad performance. Given my personal experience with Zoo, I was actually suprised to see it do better than Arc in this mode.

Granted, this is only one example. But it does show that at least for some kinds of data, Zoo 2.1 gets compression factors favorable to those previously achieved only by the "dreaded" Lharc.

Just some food for thought...

I want to use a Serial PC Scanner on my ST because of the availabilty.

I currently have PC Ditto I. How does this compare to SoftPC in Spectre (MAC).

I mostly want to use this to transfer documents using PC-OCR software.

Thanks,

Well, in my old user group (WACE) we had a cure for that..
Lift the computer about three inches off the table, and drop it!
I know this sounds drastic, but it works.. The condition you described is usually due to some of the chips inside being loose, and dropping the computer is like droping a hammer on its handle to push the head on tighter..
(NOTE: Although this works, don't hold me responsible if your St winds up in several small and inconvenient peices :))

This does indeed make things interesting! This is one of the
main reasons I do NOT like the ST incarnation of WP.
Different fonts can be used on other versions, e.g. Mac and
msdos, but not on the ST! (Amiga?)
I would really love to have other fonts with WP...even if it
meant only using ONE font...as long as I could design the
layout of the font and be able to get to the upper ascii
characters with a key-stroke (e.g. with caps-lock on, or

something like that).
Thanks for your input, Bob, and I second your call for help
from others...and maybe I'll write to WP (again).

Also, remember to ground yourself! I did that to my 520 in the winter of 85. It was dry in the house, and I thought I could get away with it by immersing myself in the stream of my ultrasonic humidifier. I pulled my mmu and glu out of their sockets, rubbed pencil erasers over the contacts to get rid of the oxides, and then put the chips back in. I turned the power on. A blank, white screen stared back at me. At that moment, I thought my chance of getting out of the dungeon of MIT (with insanity certification) just evaporated. Well, not quite. $140 (parts and labor) and two weeks later, the beast was back.

Ever since then, I've always attached myself to a wire (tuck a strip into my metal watch band) and connect the other end to the ground on the wall socket. The human body can easily generate up to 10000 volts of static electricity.

> case but not in the latter? Still, it seems strange.
> BTW, this is with Arc 6.02ST.

I once tried to arc an uucoded arc file with unix 5.12 arc version
after about 1/2 an hour I got the message 'Disk full' or something
it turned out that the arc program used up about 100Mb diskspace
(OK it was a large file 1 a 2 Mb, but not that large)

I think it is the 'crunching' algorithme thats breaks down under certain
conditions like compressing compressed data. Therefore you could consider it
to be a bug of the arc program not recognizing this.

Am I wright? (any comment of programmers of various compressors)

look, we've been thru this before. u can get source to lharc 0.03 (beta)
which, as i described, has worked fine for me on plenty of archives,
from atari.archive.umich.edu. i compiled mine from that c source on
an ultrix machine and have been using it with no problems.

>first place :-).

standard zoo is complete garabge compared to either arc or lharc. if
u want ease of use (with subdirs) and speed, use arc. if u want good
compression use lharc. there's been no reason to use zoo until
very recently. with the advent of the "high compression" method
zoo is now viable, but before it wasn't even in the running.

>>decided to tell me that his Amiga could do that !!!!

First of all I think this phrase may have been taken out of context.
Perhaps what the 15 year old meant was "my amiga can raytrace too", not
thathis Amiga cold run at the same speed.

>I call that Amiga mentality. Case of point, just keep reading reader's letter
>section in any non-dedicate PC magazine, such as Byte, Inforworld. Once a
>whlie there will be an Amiga owner writting letter to complain about either
>the lack of coverage of his machine, or his machine could do the same thing
>as well.

And if you go back to the 1986-87 era Mac users were doing the same thing
before the Mac was accepted as a "serious" business machine. The complaints
are justified again BYTE however. BYTE Used to be a general industry
magazine but now 75% of the articles are about the PC. It is getting
better (more Unix, Mac and Amiga articles) but is still mostly PC
oriented. All I can say is, the technique of writing to magazine editors
telling them you want more coverage of product X works, and now the
Amiga is covered in many US non-Amiga magazines. (BYTE-occasionally,
Video PROphiles, Camcorder Magazine, Electronic Learning, CGM)
Perhaps if more ST users would write into magazines asking for coverage
they might get some, and the ST wouldn't have such an appalling
sales rate in the US.

Asking for coverage isn't a sin as long as your message is well
written (not ranting and raving). Recently only a few letters to computer
shopper was enough to get them to restore the Amiga section (which they
removed).

Open letter to Ralph,

I started with the file "crabs" that I took from the binaries news group.
I tried UUD on my MIPS machine. I got segmentation fault, just as you did.
I tried uudecode on my MIPS machine.
A file called crabexe.lzh was created.
I then used UUE on MIPS to encode it, and got the file crabexe.uue.
Then I did "diff crabs crabexe.uue > t.di". (so far I have four files).

-rw-r----- 1 ljdickey 2174 Jul 25 18:09 t.di
-rw-r----- 1 ljdickey 10330 Jul 25 18:09 crabexe.uue
-rw-r--r-- 1 ljdickey 7304 Jul 25 18:08 crabexe.lzh
-rw-r----- 1 ljdickey 12333 Jul 25 18:08 crabs

Here is the important stuff from t.di :

1,43d0
...
< Message-ID: <binaries.15.53@twitterpater.eng.sun.com>
< Date: 4 Jul 91 17:32:04 GMT
```

```
[...]
< o /
< >--------X--snip snip snip-------
< O \
210c167
< ..8>OG83<SX LGU[._T "Jt
---
> ..8>OG83<SX LGU[._T"Jt
213,214d169
<
<
```

In my explorations, I found that if I now used the revised file,
(the one with the <T">), that UUD and uudecode would both handle
it and both gave the same results.

Of course, the ".lzh" _appears_ to be corrupted, but I did not
move the file to the ST and try to run it. It might be OK.

Comments about uudecode:
I know that the first char of a line (usually the M) tell how many chars
the decoder should find on the line. The "." (first char) seems to be
saying, pick up <..8>OG83<SX LGU[._T ">, then UUD looks at the next char
and says OOPS, the J is wrong, and should give a "sequence error".
On the other hand, "uudecode" ignores superflous characters. (It
ignored all of the trailing characters "z", "y", and so on, from the
top of the file. If your "uudecode" does not ignore superflous chars,
it is not "standard".

I hope this helps.

I would like to report that I have done some recent tests with
arc, zip, zoo, and (gasp) lharc. I have tried both ".prg" files
and tried plain text files. In my tests, lharc always had the best
compression ratios. But I know from earlier experience, that some
compressors do better with certain kinds of data than others do, so
I don't make the claim that lharc always has a better compression
ratio.

I suppose that once someone spends a lot of time playing with three
or four different versions of lharc, they might feel comfortable with
picking one version to run on one machine and another version to run
on another. Frankly, it makes me nervous, and I dont know whose
advice to trust when it comes to picking the version of lharc to use
on my machine. What I do know is that right now, I have some ".lzh"
files around that can not be extracted by "lharc_X" and I have some
other ".lzh" files that can not be extracted by "lharc_Y". (Names
changed to protect the guilty.)

What I would like to see now is a review by someone who does not have
an axe to grind who would advise me about the advantages and
disadvantages of the most recent lharc programs and make some solid
recommendations. I want to read a reasoned argument, and not
someone who shouts "Use X!" or "Use Y!", or "Its the best thing
since sliced bread!".

I do not insist on having the source code, but what I have now, and
what I want from any new archiver I might choose, is to be able
to run on my current favorite UN*X box, on my ST, and on the PC
at the office. (I hold out little hope for the Mac, in this regard;
Mac users seem steeped in stuffit and binhex. :-).

I have seen that there is some hope, because compression ratios
are enough better with lharc to stimulate my interest, but there is
this incompatability problem that I still worry about.

More than likely, the garbled screen is resulting from bad memory.
The fix will crack you up. (It's really funny!) The chips come lose,
AND you can reseat them WITHOUT opening the case. Just press down
firmly on the vented section of the case and all the way the keyboard.
You will probably hear some creaking noises. THis is FIXING things!!!

As a last resort, open the case and press all the chips (THAT AREN'T
SOLDERED) back into place. (GROUND YOURSELF FIRST)!!!!!!!

Not responsible for injuries so BE CAREFUL. It works well for me....

Someone else suggested lifting the case about 1" off the desk and
dropping it. I wouldn't recommend THAT on a machine with a drive...

Just one recommendation; I've been using ReadRight with a Logitech
hand-held scanner on my IBM at work, and-- with a few problems-- it's easily
the best OCR on the market.

I have DC Xtract 2.0 and find it Very buggy, not very useful with
Folders, will include the Folder name of the Files that they are in,
also this UNLZH172 will not work with Questers new LZH 2.0a,
If you wan't the best Pack use LZH 2.0a, and it will unpack any
LZH file.

But I find DC Xtract very slow, I have left a few messages to DC about
the problems with DC Xtract but to no evail.

All Static straps have a 1 meg 1 watt resistor fitted in them, so make
sure you fit one of these, this will stop you being killed ,
wire this resistor in the far end of the lead, and cover it with
heat shrink tubing.

Perhaps you could use something like DC Format to put an IBM boot
sector on the disk, then take it to an IBM shop to "unformat" it.
Norton Utilities has an unformat utility; however I'm not aware of
how it works (I don't think the format process writes zeros to all
the sectors, I think it just re-maps them--?)
.

Just for your information:

In Germany, the distributor of Turbo C is now Application Systems, Heidelberg
(ASH), better: of the successor of TC called PureC.

PureC is a complete development system (graphics shell-editor-Ansi C compiler-
assembler-debugger-linker). It will cost about 400.- DM. The Developpers of
Pure-Software have also done the developpement of TC 2.0.
Users of Laser-C and Megamax C will automatically be offered an update to
Pure-C.

(informations taken from: TOS 8/91, p.11)

>ST. It even puts some gibberish (non-ASCII) in the cookie jar.

I no longer have troubles, either. The problem was due to an ill-behaved program that destroyed the cookie jar. (The latter program has since been fixed!) That's why things worked when MACCEL3.PRG was loaded last but not when it was loaded first. Thanks to everyone who responded to my original message.

1559. The Vault 3.0 announcement -- THE BEST in Atari Hard Disk Backup

Newsgroup: comp.sys.atari.st
Date: 1991-07-26 13:45:11 UTC
From: fischer-robert@cs.yale.edu
Message-ID: <1991Jul26.134511.20719@cs.yale.edu>
Source record: 230138

```
************************************************************
*************** Major upgrade to The Vault ***************
************************************************************

I recently posted a number of programs I wrote, including a large
upgrade to The Vault (hard disk backup -- fast, safe, reliable) to
comp.binaries.atari.st and comp.sources.atari.st. I also uploaded
them to atari.archive.umich.edu for anonymous FTP. Some have been
filed while others are still in the atari/new directory.

40424 Jul 16 21:17 ff32bin.zoo Speeds up floppy disks without reformatting them,
safe, faster than Twister.
30689 Jul 16 21:17 ff32src.zoo Source for ff32bin.zoo
164028 Jul 16 23:52 lynxlib.zoo C library needed to compile most of my programs
15353 Jul 16 21:17 mclock.zoo Corner clock, works even on Megas, also has option
for a 100-hour-per-day clock
20191 Jul 16 21:17 shfflbin.zoo Game -- makes a puzzle out of any bitmap picture
12523 Jul 16 21:17 shfflsrc.zoo Source for shfflbin.zoo
31371 Jul 16 21:17 sokobin.zoo New port of Sokoban, lets you take back as many
moves as you like.
19515 Jul 16 21:17 sokosrc.zoo Source to sokobin.zoo
29007 Jul 17 10:50 key.zoo Repost of the key -- restore program for The Vault
This is no change from the last version of The Key,
posted over 1 1/2 years ago.
99880 Jul 16 21:17 vltbin.zoo

The Vault 3.0. The best in Atari hard disk backup just got better!
If you use The Vault, upgrade to version 3.0. It is totally
rewritten, has a much better user interface, and has been well tested
for half a year now. And it still writes TOS-format disks with the
same speed it always has. I you don't use The Vault, try it -- you'll
like it.

If you have any questions, comments or problems with any of the above
programs, please send a message directly to me at
fischer-robert@cs.yale.edu. A message posted to a newsgroup will
never get to me, because I don't read newsgroups.

Enjoy,
--- Bob

>I am considering upgrading to an Atari TT. As I understand it TT's
>only come in two models: the TT/2 and the TT/8. Is the ST RAM *only*
>on the mother board, or is half of it on the extra TT RAM card?

A. Pratt from Atari posted info about TT RAM a while back. Here in the U.S.
one can purchase TT/2, TT/4 or TT/8. The TT/2 is ST RAM 2M on the Mother
Board. To upgrade or purchase TT/4 you will get 2M more of ST RAM on
a ST RAM daughter board. To upgrade or purchase TT/8 you will get another
daughter board with TT RAM - another 4M of RAM (these are SIMMs -
no SIMMs for ST RAM).
>
>Also what kind of RAM is in the two types of RAM for the TT: SIMMs,
>SIPs, chips, or some mixture of the above? I would prefer getting a
>TT/2 and upgrading the ST RAM to 4 Mb in the case that SIMMs are
>involved. I would probably later on, sometime next year when the
>European plant for 16 Mb chips starts operation, get the faster TT RAM
>when prices would fall.
>--
You can expand ST RAM to get a total of 10M. If you replace the 1M SIMMs
from the TT RAM daughter board with 4M SIMMs you will get 16M of TT (fast)
RAM. That means total memory could be 10M + 16M = 26M.

>Ralph P. Sobek Disclaimer: The above ruminations are my own.

>Phone: (+33-)61-33-62-66 FAX-1: (+33-)61-33-64-55 FAX-2: (+33-)61-55-35-77
>==
>Got a Mega 4 ST. Wishing it was a Mega STe! :-| Do I *really* want a TT? ;~#

You may not want a TT - STe is much cheaper and you can update memory with SIMMs.
I have a TT and a ST. Many programs run on both, but of course, most games from
the ST will probably not run on the TT. I believe that all of the Double Click
Software that has been posted in the binaries is ST and TT compatible.

CUL,
Chuck

>None of them contained the .au converter to ST digitized sounds which is
>too bad, because that was the only thing I really wanted from the archive.
>Dave, if you are reading this, could you please put that file in
>atari.archive, thanks.

Before we get TOO excited, I should mention that the main reason I never posted the converter before is that the sound quality you get from the resulting sounds sort of, well, leaves "something to be desired". It works, but some sounds come out better than others. (I've never been able to understand why the uLaw encoding process seems to lose information. You should be able to get 8-bit resolution back. BTW, I did it two different ways, both by the uLaw spec, and both sounded about the same. Hmmm.)

The digistuf.arc that's currently up on atari.archive is OLD. I did post the new digistuf.arc but the good fellows at atari.archive haven't put it up yet. (They have real lives too?!?!?) In any case, my announcement was perhaps premature. Sorry for the confusion, folks. Look for digistuf.arc next week.

Dave Baggett

And you won't. Start is dead, along with Antic (the magazine, not
the company -- the company is now putting out a PC rag, "PC Home
Journal.")
And speaking of Start, is anybody else having trouble
collecting money owed for articles printed? Antic Publishing has
owed me over $1,800 for nigh six months now and is refusing to
acknowledge that I exist, despite the fact that I've been to Small
Claims and won a settlement against them. The money guy there,
Chris Ballard, won't even call me back -- even though I've
threatened to send in the sheriff to start impounding stuff.
And since the company still exists, shouldn't we subscribers
be getting reimbursement for undelivered issues? Or issues of
another magazine?
Ah! Nothing like a healthy instance of getting screwed to
make you look at the world with a bright, sunny outlook.

From: jan@janhh.hanse.de
Message-ID: <1908.07.91@janhh.hanse.de>
Source record: 229978

Patrick Hawke asked:
> I currently have PC Ditto I. How does this compare to SoftPC in Spectre (MAC).

Maybe the better question would be how does PC Ditto compare to SoftPC
on the ST. On CeBit '91 I talked with someone from Insignia who said
that had already finished a ST-Version and Atari has it.

Does anybody know why Atari doesn't release it ?

FOR SALE:

Atari 520STfm upgraded to 1meg RAM and DSDD floppy.
Has external "mungo big" industrial power supply that can
power several HD too. (power supply is > $100 value)

SM124 mono Monitor.

NEC P2200 24 pin printer and cable

Home built HD adapter to attach a SCSI disk.

Atari Word Perfect

Microsoft Flight Simulator
Balance of Power game

HD backup utility

Lots of PD disks

Personal Pascal v2

This machine has not been used for a year because I
started to use a Mac for my MIDI due to a piece of
software that I needed on Mac.

All for $600 plus shipping.

>the sectors, I think it just re-maps them--?)

No, the format uses the WRITE_TRACK command on the FDC... The whole track is written over with some gaps between the sectors, and some header info. The sectors themselves are written with a 'virgin' value, usually $E5. The norton utilities won't do it, I think the way that they work is to use a non-destructive format (that is, read the sectors, write the track, write the sectors). It is IMPOSSIBLE to recover a formatted disk.

... [deleting a nice example of function prototype usage -- JO]

Well, I know about function prototyping. The problem is that
I had ANSI compatibility switched off. Now in that case the compilers
I've used has supported forward and backward references without
function declarations. In effect making them "old style K & R C."

As far as I know, ANSI's spec doesn't tell you whether a compiler
is going to be restricted regarding forward referencing when ANSI
compatibility is "disabled". (An interesting point of logical reasoning
there. :-) So properly, it's a subject for the manual to discuss in
an appropriate place. I'd put it in the general description of the
compiler. Alternatively, it might be mentioned in the area of compiler
switches. If possible, it should be *everywhere* that one might reasonably
look for it.

So far, I think the Lattice C compiler will be a very satisfactory
compiler (subject to that 1 major compiler bug that I seem to have
hit in my most important project), but the 1st edition manual is
annoyingly deficient in many ways. I hope I'll be able to arrange to
buy an updated manual.

^^^^^^^^^^
>
> David Koski

No it's not. It's just very difficult and you need some expensive equipment.
The reason it's still possible is because very seldom do the read/write heads
line up in the EXACT same place for a given track so there is usually
some of the old information available. It is like this:

* - old info
= - new info (ie. from the format or whatever)

blah blah blah blah blah ...
track x blah blah blah blah blah ... (where blah = bits on disk)
blah blah blah blah blah ...

********************** ...
track x+1 ========================== ...
========================== ...

blah blah blah blah blah ...
track x+2 blah blah blah blah blah ...
blah blah blah blah blah ...

So if you have the correct equipment and know enough about how a given
disk system stores information, you can read the disk bit for bit using
a track density about five times higher then the original and then pick
out the stuff you want. If you know what was written over (E5 E5 E5 for
most ataris) then it is even easier to find your original data. Even
when you actually write directly over the top of data it is possible to
read ghost images from the disk, again with the correct equipment.

1573. Mint

Newsgroup: comp.sys.atari.st

From: sma@walt.disney.com
Message-ID: <sma.680571681@walt>
Source record: 229957

I have started using mint. I have bash, mgr, ksh. I had to dig out an old copy of mg (micro-gnu emacs) to do editing, as my vi and emacs crashed mint. So I have a basic system and want more. Several of the sample scripts/setups with mint referenced other utilities but I don't know where to find them. I have rummaged through archive, but it is difficult to try to find mint compatible progs/utils etc.

I would appreciate any pointers to archives or utils/progs that are mint compatible. I would also enjoy working on the mint system (in all of my spare time :-) if needed.

Thanks

Ah, but it isn't "quite rightly so. You see, I didn't bother
-
a
Ah, but is isn't "quite rightly so." You see, I didn't bother
stating all the permutations that I tried (it would take a few pages).
Some of the permutation I tried was declaring all functions as "int"
and then making sure that they in fact did return an "int" (value of 0
if I needed a dummy value). So even if the functions "assumed to return
ints", I had that covered.

There seems to be "something else" going wrong. That's why I
called it more generically "a referencing error." That was the best
way I could think of to describe an error caused by lack of support
for forward referencing.

>matter how many passes it makes). I also write my C programs with main() at the
>`top', but I also religiously declare all the functions I'm going to use. It's

You want to get UPS from the University of Kent.
Check ARCHIE for the exact machine.

UPS is 10 times better than DBX, SDB, GDB, and that ilk.

It has an Ansi C interpreter built in; you can type in code,
splice it in, and hit the GO button. Very very slick.

Lance

Don't know how Norton's utility does it, but in DOS5.0 there is actually two
format. One will physical format the disk and destory the data, the other one
(called quick format) will reset the FAT table area and if the disk has enough
space left, it will keep a copy of FAT to that place so the disk can be unformat
, however it does not work with normal reformatted disk.

I was using my 1040ST as a terminal emulator this afternoon
when a power surge (?) simultaneously killed the ST modem port
as well as the serial controller board on the host computer.

The serial controller board showed visible signs of heat damage
but the atari board looks flawless. Does this mean the atari
damage is minor?

Could someone recommend a good repair facility --- reliable,
inexpensive, and fast?

Just thought I'd drop a note to the net letting all of our international friends know that Double Click Software will be attending, displaying and selling our wares at this year's Atari Meese show in Duesseldorf.

We will be showing something of particular interest to owners of AT Speed or PC Speed. Can't say more, you have to wait. :-)

We will also be showing (but not selling) our new game authoring package. Wow, it is hot!

Plus, our DC Utilities, DC Desktop, DC Shower and (tadum!) Data Diet - the _only_ realtime compression program for the Atari computer. Not to mention our DC Port serial expansion cartridge, too.

We really look forward to meeting our net friends face to face (and sharing a few rounds with them too!).

The Cleveland Free-Net Atari SIG's Programming/Developing Forum is growing
in usage and population.

Atari computer users are working on new projects both in software and
hardware.

If you are a programmer or even a developer, why not help users bring new and grea
great products to the Atari world?

You can discuss almost any programming topic that you wish. The only thing
we cannot allow is for developers to release classified developer information.

If you are interested in programming or making great things for your computer,
why not log on to the Cleveland Free-Net?

You can 'telnet' any of the following:

129.22.8.82, 129.22.8.75, 129.22.8.76
freenet-in-a.cwru.edu, freenet-in-b.cwru.edu, freenet-in-c.cwru.edu
cwns16.INS.CWRU.Edu, cwns9.INS.CWRU.Edu, cwns10.INS.CWRU.Edu

If you realy think an IBM shop can unformat disks then there should be no problem. The STE makes standard IBM disks so there is no need to use and extra programs such as DC Format. Go ahead and try whatever PC stuff you think can recover the disk. Good luck.

It is not the body itself but dry hair and certain types of clothing which
can generate static. Simply by avoiding woolen and synthetic fabrics it is
possible to considerably reduce the danger of static. I have never earthed
myself before handling delicate CMOS components but I take care to avoid
certain movements which generate static:

shuffling on carpetted floors,
ruffling, rubbing or scratching of the hair,
sleeves rubbing against the wrists.

I haven't fried a chip with static yet!
Also it is not good to have cats nearby. I once had a program crash because
a cat walked to close to the computer (no, it wasn't an ST)!

Pure cotton and linen generate virtually no static. I guess hemp and nettle
are also similar fabrics electrically (if you can get them).
Wear vegetable fibre!

Also it is a good idea to rinse the hands before starting.

1587. Atari ST languages for sale

Newsgroup: comp.sys.atari.st
Date: 1991-07-27 20:03:30 UTC
From: kimmel@umvlsi.ecs.umass.edu
Message-ID: <1991Jul27.200330.10965@risky.ecs.umass.edu>
Source record: 229967
Cross-posted to: misc.forsale.computers,ne.forsale,comp.sys.atari.st

I recently sold my Atari ST system and was left with a bunch of language
software. So...

FOR SALE: TDI Modula-2 $20
An older version, I think, but a good
starter system for someone who wants to
learn Modula-2.

Personal Pascal v2.0 $30

Mark Williams C v3.0 $40
Includes CSD source-level debugger and
resource editor.

Abacus Assempro $20
A rather nice assembler/debugger package.

Philon FAST/BASIC-M $35
A sophisticated BASIC compiler.
IBM MBASIC-compatible.

All prices are negotiable! E-mail me if you're interested!

From: bremner@cs.sfu.ca
Message-ID: <1991Jul27.210143.13694@cs.sfu.ca>
Source record: 230019

Problem: Bibtex C Version 0.99c (atari.archive:atari/tex31/bibtex.zoo
) locks up when I run it, right after it says "The style file:
plain.bst"

I am running a 1040ST, with TOS 1.x, x < 4, 1 Meg of memory.

The only things in my auto folder are foldr140.prg, and supra hard
drive boot and clock-read.

Is this known to work on one meg ST's ?

I am running from within Bammi's minimal shell, but TeX runs O.K., so
I don't think thats the problem.

Hello.

Perhaps this is interesting news for you: There is a new version
of lharc (lharc 2.0) which has a new compression method. It packs
better than zip. I could send Thomas Quester's version to comp.binaries,
but I better ask him first...
Anyway, it has already been distributed through the Maus-net here in
Germany...

Greetings,
RIPLEY

>Anyway... Does anyone have any (reasonable) suggestions,
>recommendations, tips, leads, etc. on a good multisynch
>or other compatible monitor for a 1040STf?

My multiscanning monitor is an Acer 7015 Multiscanning Color Monitor. It cost me about $450 dollars new at my Atari dealer. One problem: the IB Mult-Switch adapter I use to hook up the monitor reaures a 9-pin analog RGB monitor port, while the Acer has a 25-pin analog port. I had to buy a 9-25 pin adaptor cable to hook things up.

The monochrome is not as sharp as a dedicated monochrome monitor, but still very acceptable. And the color works just great.

1595. Personal pascal 2.05

Newsgroup: comp.sys.atari.st
Date: 1991-07-28 12:46:32 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.680705192.larserio@kvart.ifi.uio.no>
Source record: 229976

PERSONAL PASCAL Version 2.05

The following bugs/difficulties reported for earlier versions were FIXED:
==========

1. Esc key doesn't always clear editable text field in dialog box.

2. Off-center dialog boxes not displayed correctly.

3. The default button in Compiler Options dialog box doesn't respond
to return key.

4. Read(char) waits for carriage return to exit.

5. Bugs in register allocations.

6. Arrays having more than one dimension incorrectly compiled if size
was over 32k.

7. EOF and EOLN improperly handled. Last line of text file not read if
no cr/lf at end of file.

8. After reset(f,'CON:') EOLN is correctly edited and input can be
edited.

9. Entering/exiting supervisor mode sometimes caused bombs.

10. Obj_Redraw and Show_Dialog not in libraries.

11. Read and write cannot be used in random access file i/o.

12. Demos don't compile or run properly.

13. Improper memory allocation through new/dispose.

14. Procedural parameters didn't compile or run correctly.

15. The author states "there were a lot of other fixes in the last 1.5
years but I don't remember them."

The following bugs/problems are still known to exist.
==========

1. Pressing alternate-N more than twice bombs the editor.

2. Cannot exit editor with keystrokes after closing file from menu.

3. EDIT.RSC must be in the current default directory.

4. Long_trunc sometimes delivers incorrect value. Solution is to use
the function longtrunc in file LTRUNC.PAS.

In addition the new COMPILER call appl_exit as it should when it exits after
a succesful compilation (the old one forgot, and this caused crash after 5-10
compilations on some machines....()

1596. Power supply for Atari DS and SS disk drive

Newsgroup: comp.sys.atari.st
Date: 1991-07-28 14:30:49 UTC
From: unknown@disk.uucp
Message-ID: <1991Jul28.143049.1154@disk.uucp>
Source record: 229998

Does anyone know how much power-supplies are for the ATARI SF314 DS drive
and the ATARI SF354 SS Drive? During an elictrical storm (with the system
up!) the SS drive stopped working. So I switched power supplies between
the two, and found it was just a bad supply. But the bad supply must
still send some strange voltage, because the drive it's hooked up to is
constantly spinning with it's light lit. I've tried the drive with the
good supply, and it works perfectly.. Anyone heard of this condition or
have any fix for it or where and how much for a new power supply?
Thanks.............

1599. 1040STe questions

Newsgroup: comp.sys.atari.st
Date: 1991-07-28 22:20:59 UTC
From: azog@world.std.com
Message-ID: <1991Jul28.222059.4531@world.std.com>
Source record: 229981

Well, in a few weeks, I will have the money to purchase a new 1040STe
to replace my lightning-struck 520STfm, and wanted to ask a few
questions... (had to sell one of my beloved pdp-11s to get the money)

Anyways. I know the 1040STe can use SIMMs for memory upgrade, and
I am curious as to the difference between 1m*8 and 1m*9 SIMMs.
Is there any pin difference? If I plug in a 1m*9 into a 1040STe,
what will happen? Will it work, and just ignore the extra bit?

Also. can the 1040STe use the 1mb TOS parts, that are found in the
Megas? Reason I ask is I would like the TOS in a Mega, but cant
afford a Mega STe! (1040STe for about $380, Mega-2 STe for about $1300,
yes I relize its got a hard drive, but I cant get that kinda cash)

I mostly do MIDI with some other 'hacking' (Ive thought before my
520ST died, and after, about an Amiga, its does have some nice
gee-whiz features, you must admit, but Ill stick with Atari, thank
you)

Also, I see lots of complaints about problems on Mega STe's, and
am wondering if any big time major bugs live in the 1040STe?
I wont be using Spectre or anything fancy like that...

Thanx

1600. Idea for a program (maybe DC?)

Newsgroup: comp.sys.atari.st
Date: 1991-07-28 22:44:08 UTC
From: r_gambs@etsuv2.etsu.edu
Message-ID: <19468@helios.TAMU.EDU>
Source record: 229983

I just thought of a neat idea for a program. Maybe it already exists and
if so, if someone would point me in the right direction, I would appreciate
it. What I need is a Quota program for my HD. It would tell me how much
of the disk is used, and maybe break it down with a bar graph for each
partition. I hate having to do a 'show info' for each partition individually
then whip out the old calculator. I have a Syquest drive and ICD Host,
if it makes a difference.

>Norton Utilities has an unformat utility; however I'm not aware of
>how it works (I don't think the format process writes zeros to all
>the sectors, I think it just re-maps them--?)

Formatting a disk on an ST completely overwrites all data in all
sectors. What you mean is what one might call a 'logical erase'
operation which is offered by some formatters and GEMINI as an
option. In this case, you probably could save the data, but not
after a standard format operation. This whole confusion stems
from the fact that those DOS people don't seem to know exactly
what they are talking about when they speak of 'formatting a disk'.
Sometimes they mean 'low-level formatting', sometimes just
'logical erase'.

Source record: 229997

One week ago I posted the problem to the net, and as I got some
messages back via email, I think It is worthwhile summarizing.

I will include only two (small) letters I got, as most were either
similar or not of help.

Anyway, thanks everyone who reacted.

> From: LarsErikOsterud
>
> On my MEGA STE I get the "Drive A: not ready / not responding" all the time,
> but a click on "RETRY" and everything goes well. Could be a drive problem
> (my first drive stopped stepping, and this one is an old one Atari had lying
> around .-)
>

Strange, I don't get that particular message. Not at all.
Except ofcourse when there is no floppy in the drive.

But what I meant is, the message:
"Drive A does not exist",
and this does not have a "RETRY" button, only "OK" or so.

And even tryinf thousands of times doesnot work out.
Only cold-booting once or twice.

I got a mail from John Henders:

> From: John Henders
>
> This problem has been reported elsewhere. It seems to come from
> interference from the monitor. Try spacing the monitor a few inches
> above the computer or put a cookie sheet under the monitor to see if
> that fixes the problem.

I did, but I have only used the computer once since that, so
I'm not sure that this really solves my problem.
But it looks promissing.

Yes, I know everyones finished it, but I've not
had much time to play games, any way my questions.

I have found a scroll which appears to have some
coded information on it, can some one tell me how
to read this scroll. it starts GYNRAX well something
like that.

What does the Gem of Ages do ?

Are there four pairs of Boots of speed ? I've only
found the ones near the entrence to the Demond
Director.

PS is there anyway of getting the oracle to tell
me this sort of information ?

E-mail replies rather than postings please.
Thanks in Advance

> Maybe the better question would be how does PC Ditto compare to SoftPC
> on the ST. On CeBit '91 I talked with someone from Insignia who said
> that had already finished a ST-Version and Atari has it.

Why, oh why did they give it to Atari of all people? OK, maybe Atari
Germany won't screw up the distribution, but I wouldn't be confident
about any of the other operations (well, maybe Canada aren't too bad,
from what I've read).

> Does anybody know why Atari doesn't release it ?

Because they just LOVE sitting on products for years while they decide
whether to release them or not, whether to sell them or bundle them,
what price to charge, etc. - in the UK we have the examples of
Hyperchart and the Epson emulator for the SLM804, each of which could
have been released a full year earlier than they were.

I won't mention hardware delays. Well, except maybe for the CD-ROM
drive. (Again, I except the few Atari subsidiaries who are actually
marketing the thing - they are a minority.)

This is good news. ASH have a good reputation. Their prices tend to be a little on the high side, but their support is good.

Now, I wonder if this upgrade offer applies to all Laser C users, or just those who bought their copies from Application Systems Heidelberg? (At least part of Megamax has now taken to calling itself Applications Systems Dallas, for what that's worth.)

It would be nice if ASH offered the upgrade to all registered Megamax/Laser C users. Does anyone from Germany have any information on this?

PureC is an improved version of TurboC 2.0 - they have improved compiling
speed and and the help system, and a new assembler (68000-68040) is
included. As an owner of TurboC2.0 ('Profi-Pack' - incl. Source-Level
debugger etc.), the update would cost me 150.- DM - I think that's pretty
much money for the minor improvements I would get :-(

>since sliced bread!".
Some days ago, I've got lha200 from minnehaha.rhrk.uni-kl.de; its an lharc
version 2.0, so it can unpack the lh5 method which is even better in
compression than the 'old' lh1 method. This version is from Th.Quester and
he seems to be aware of the incompatibility problem, because he built in
a switch for compatibility with those old unix-lharcs and others, which do
some wrong things with the headers in the lzh file; so there should be not
more problem. (but do _not_ use the lh5 method when posting something, because
not everyone can unpack it)

How do you get the printer port to output. Is there a schematic for an
interface? I would assume it was just some DAC chip on the parallel lines.

Anybody have information on such a critter?

Yes, it will work and ignore the parity bit, I got mine off of
the net and they are working fine. Better than before actually, since
Spectre screens were showing patterns of stuck bits in my original
memory. Do note, you lose your 90 day guarantee if you do it yourself
(the tell-tale sticker must be removed 8-).

You mean the TOS ROMS... Mega STE ROMS (TOS 2.0x) might work, if
there are only two of them. You'd probably lose the analog joystick
port support, and the ROMS are not officially available. Earlier
TOSes won't work at all (including TOS 1.4), and are less good than
the TOS 1.62 that comes with current machines. Some programs don't
know about 1.62 yet - pinhead 1.8, an STE demo program - nothing
catastrophic. Good luck, post your experiences if you succeed please.

Spectre works just fine. I do suffer from the DMA sound/shifter
problem documented by Lars Erik Osterud. It's annoying, but not
fatal - unless it stops you from seeing Spectrum pictures. I run a
mono machine for now.

MaxiFile 3 from CodeHead has such a function. It gives a bar graph for each drive (including floppy), and you may select information on any one or all of the drives. There is also a numerical display next to each bar indicating the total capacity of the drive, number of bytes used and free and the percentage of the drive used and free.

Just one of many reasons to get this fine program.

> It looks like it's a habit I'm going to have to get into.

I can't address the issue of whether the Lattice compiler really requires this, because I don't know what version you have and I can't try it, but if it does, it's wrong. My ANSI C spec (admittedly a draft from 10/86) in Section 3.3.2.2 (Function Calls) states:

"If no declaration is in scope for an identifier used as the first expression in a function call [that is, the function to be called], the identifier is implicitly declared exactly as if, in the innermost block containing the function call, the declaration

extern int identifier();

appeared."

Thus, the behavior is not "implementation defined" but very specifically defined by the spec.

I have droped QuickBBs for many reasons but the most important is it's
lack of fiability. I have expressed to Jon Webb my desapointment in the fidonet
QUICKBBS echo with full details.

This is a little summary of my troubles:
-Sometimes (very often) the system locks completely or crash. This can
append at anytime in any part of the sotware. I'm not the only one who have this
kind of misfunctions, i know anthoer quick bbs sysop who have reported the
same things.
-Somethimes (very often too) messages were saved with physcho hallo-
genic heaer. These header can contain everything: strings of menus, internal
strings of quickbbs or even 68000 code. Sometimes, somewere a pointer is
trashed and give this strange result.
-Informations about the curent user are to small for doors programs
and give back modified informations to the main program is nearly impossible.

I can't renember exactly all bugs i have founds (Jon is advertised for
almost of thems) so i can't give a full list in this message.

I have decided to write my own bbs. It's on the way and will be
operational in one or two months.

I believe that UNLZH v1.72 is probably the best utility to use. It's
4 times faster at unarching .LZH files than anything else and I have never
had problems with any lzh file. Probably the best all around LZH archiver
is LZH11316.

1631. mntolb10 vs libolb71

Newsgroup: comp.sys.atari.st
Date: 1991-07-30 05:10:41 UTC
From: rosenkra@convex.com
Message-ID: <1991Jul30.051041.306@convex.com>
Source record: 230007

well, i have finally done it: i am switching from good ol' alcyon to GNU c. i was able to daisychain my old sh204 onto a megafile 60 (for the curious, the mf60 has both in/out ports and all u do is change the sh204 to LUN 1 with the little switches inside and plug it in - i use ahdi 3.0something - power the sh204 first, then the mf60, then the st) so i have an extra 10-20 MB free. i have gcc up and running (except the problem with redirecting stderr under gulam - but that will be solved when i get mint and bash or ksh up, i hope). i am still having problems with make (3.54 and 3.59) but i think i can figure it out (once i get the sources, that is).

my question (for eric or bammi or whomever) is what is the relationship between mntolb10 and libolb71? the latter was recently uploaded to a.a along with gcc 1.40 (appearently). i am assuming that mntolb10 is not as current as libolb71, but then again it is mint-ized. and what relation to "official" gnu.olb are these, version number-wise? if i go with mntolb versions, is is safe to use the includes and .olb's from mint and trash the libolb versions? are there any problems with gcc 1.40 and gas 1.37 and ld 71 (i think), what i have now, with the latest (version 10) mntolb? in otherwards, will i have to keep both sets of .olb and includes hanging around? i probably will diff the include files, just to amuse myself.

one more thing: will uniterm 2.0a run under mint? if not, will 2.0e?

just one more thing: does make 3.59 read the environment for macros (else why the "setenv gcc path\gcc" in gnu.g)? i use gnu make under unix, so i look forward to using it on the st.

heck, one more thing: how does gcc 1.40 support floating point now? is pml incorporated into gnu.olb now? do i need pml.olb? i tried a small project (a simple calculator entirely in yacc - which went thru bison and gcc without a hitch) and did nothing special to compile (i.e. no "-lpml" or whatever). it worked fine.

i have been able to compile BSD system software virtually unchanged (e.g. 4.2BSD ls.c compiles with 2-3 changes - like kill utmp.h stuff), which will be a huge timesaver. porting should be a joy (compared to 16-bit alcyon). and i expect mint to be just as nice to work with. i like the fact that the gnu library is already fairly POSIX compliant (like dirent.h rather than sys/dir.h). saves me lots of time. i can kick myself for recently taking the time to update my own dirent stuff for alcyon (made it POSIX compliant). on that note, if any sozobon users want readdir/opendir/closedir/rewinddir/seekdir/telldir (dirent stuff), drop me a line. i will post it.

now with gcc and RCS, i can start on nroff 2.0, or possibly look into
porting groff (BTW: has anybody started this?)...

>much money for the minor improvements I would get :-(

Yep, I agree on this point.

The biggest part of the development cost was already funded by
Heimsoeth/Borland, so IMHO ASH didn't have to invest much money
into it yet. A nominal fee for the conversion would be acceptable,
but 150.- DM are a bit above that.

I don't consider it a wise decision of ASH trying to get rid of
the large customer-base TC had (How large was it, anyway?).
Thousands of potential updaters are not to be neglected, me thinks.

Maybe ASH should think about that again ...

Dirk

P.S.: What about going to dnet.atari or sub.sys.st with this dis-
cussion, it's getting pretty german ...

Hi there,

I have some questions concerning memory upgrade in TT030:

I have a TT030/6/48MB, achieved in Germany in 11/90:

- How can I upgrade the ST RAM? (now: 2MB)
What kind of RAM Chips do I need?
Where are they sitting? Socketed on motherboard?

- How I can I manage to upgrade TT RAM? (now: 4MB)
(same questions as before)

I know that I may need a so called daughterboard, is this beast already
built in with my 4MB TT RAM?
Where can I buy such a thinW?

Thank you for your help.

greetings Bernhard

This is fine for functions which return int, but if the function in question turns out to return void (as it very often does, I find) then this assumption rather cocks things up. I'd rather the compiler not make ANY assumptions, but then I used Algol68 for a number of years, so I'm used to this (`strict') philosophy. Like I said, it's good programming practice... :-)

1636. Idea for a (DC?) program

Newsgroup: comp.sys.atari.st
Date: 1991-07-30 11:32:46 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Jul30.113246.6662@echo.philips.nl>
Source record: 230023

I just thought of a nice small program (utility?) to have.

The MEGA STE lets you start programs from function keys,
which is really nice. Only one problem remains...
Some programs need the cpu speed set back to 8 MHz
(think of the MIDI programs with their keys in the
rom port) while you want other programs to run
as fast as possible.

It would be nice to have a program that first sets cpu speed,
cache on or off (and probably blitter as well) as required
for the specific program you want to run, and then exits by
starting that specific program (handing the default
directories, etc to that program).

>Is there English documentation [yet] !?!?!?!?

I don't know about english docs. If you have the TC2.0 professional pack
(that is TC + MAS + Turbo-Debugger), the update costs 150DM. They only
want to know your BORLAND serial numbers. If tou have older TC versions
or do not have the Assembler/Debugger, the update gets more expensive.
I have not got the address of ASH at hand - sorry.

1639. Re: TT memory (was allocation)

Newsgroup: comp.sys.atari.st
Date: 1991-07-30 13:24:03 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.680880243@cst2>
Source record: 230024

This is in reply to which is better STe or TT.
Allen Pratt mentions that the TT can use VME cards. I think few people
who buy a TT will care. At least I won't.
As far as memory concerns. Yes you can have more memory in the TT, but
it will cost some $$.
The 68882 is definitely a benefit if you do a lot of math work.
For graphics programs/text processing/compiling/program development
there is no gain in it.
Also don't overestimate the 32 Mhz 68030 (I did; the TT was not as fast
as I expected it to be). The memory subsystem still runs at 16 Mhz, not
32, and that is a major bottleneck.
The TT when running in ST ram performs about 3 times as fast as a 1040.
In TT ram the gain is about 4.6 (figures based
on dhrystone runs under MINIX; same binary, so no use is made of the
special 030 specific instructions; both caches on and in burst fill
mode)

ST games typically don't run on the TT, or are too fast to play.
It seems that most utilites are not that much of a problem.
Furthermore the TOS 3.05 desktop is definitely impressive.

If you have to choose between an STe or TT definitely look at the
use you are going to make of it, the amount of money you can afford etc.
I strongly recommend buying the 6MB or 8MB models which have TT ram.
The price/performance ration drops by having TT ram.

I remember having problems with Eternal too. Try EDISK v2.1. I
don't think that Eternal2 (v2 was the latest version of Eternal) even
works correctly with 4meg. EDISK was based on Eternal2 and is written
by Volker A. Brandt. Here is a short excerpt from the docs:

EDISK features:

- Works with 4 MB RAM. (V1.6)
- ECONF companion program configures RAM disk directly. (V1.6)
- EDISK displays a message on restart. (V1.6)
- Fast data transfer to/from even-address buffer, using "movem". (V1.8)
- 'Real' boot sector, thus enabling disk editors etc. to run. (V2.0)
- Driver fits into RAM disk boot sector, thus saving 512 bytes. (V2.0)
- Configurable size (10 to 3900 KB), 16-bit FAT for speed. (V2.0)
- 'Virtual 2nd FAT', ie. we save one FAT but pretend to have two. (V2.0)
- RAM disk volume label shows version and boot time. (V2.1)

Due to the 'virtual FAT trick', the RAM disk actually provides more
space than an equivalent 'real' disk. It does require that it is first
in the auto folder so that it can control the hard-disk vectors, as is
the case with all reset-proof ramdisks that I know of. Tho, I do run
Pinhead 1.8 Before EDISK 2.1 for faster booting. You can find EDISK
2.1 on Atari Archive under utilities/edisk21.arc.

>particulary, version numbers. Like what version of System/Finder is the
>definitive one to use?
>
>Bob Malay

I thought I might as well post my answer in case anyone has any similar questions.

1) The system version to use should either be 6.0.5 or 6.0.7 the differences are: 6.0.5 is ROCK SOLID on both the Mac and Spectre, but does not support True Type. 6.0.7 has a few bugs (nothing too bad, but you will have a few more resets from time to time), but supports True Type fonts. Also, Spectre sound does not work with 6.0.7, but it does with 6.0.5 and under. I'm currently running 6.0.7 and having very few problems, occasionally I get "Finder out of memory" errors when they should not exist (I tried increasing my Finder memory allocation, and it did no good).

2) ATM. Everyone with a Mac should have ATM. First, there are lots more ATM fonts than there are True Type, and also you can convert ATM (type 1 postscript) into Calamus and Pagestream formats. ATM also prints in about 1/2 the time of True Type (I've timed it myself), and looks just as good. True Type is nice because you don't have to have seperate screen and printer versions of the fonts however. Also, True Type includes all the System fonts, which is nice (and why I went to 6.0.7).

3) You might want Resedit. I used resedit to alter all my mac Icons and Menus to look more like NeoDesk on the Atari so I would get less confused when going between systems. I also used it to make my Mac seem less "User Condesending", no more cutsey little menu names (ERASE DISK, come on!) Changed it to "Format Disk" like it should be. Changed "SET STARTUP" to "BOOT PARAMETERS" and so on and so forth. This can be really helpful if you are always pulling down the wrong menu...

4) There are lots of neat utilities out there to make your Spectre (or Mac) look really neat! I would stay away from these, they work just fine on the GCR, but the take up memory and make startup take longer. This is a pitfall many Mac users fall into (I know one guy that uses over 40 INITS, takes him about 2 and a half minutes to boot up!). Also, remember that you don't need a screen saver for the GCR because you can switch the monitor off, this can save you more memory. You could say the Mac is not exactly memory efficient, I have a Mega 4 and run into lots of memory errors with big applications (PageMaker & UltraPaint).

5) Mulitfinder works fine on the GCR, but try it with just finder for a while and see if you really need multifinder; If you don't then you will again save lots of memory.

6) Word processors: I prefer WriteNow 2.2, it is quick, reasonably powerful, and easy to use. It has a Dictionary and Thesaurus, both of which work very nicely.

If you have any other questions just knock...

David Butler
(dhbutler@magnus.acs.ohio-state.edu)

(P.S. I hope this entire message gets posted, the editor here on Magnus often deletes parts, generally the original posted message I'm trying to answer, even though it is sitting there behind the > just fine on screen in my editor, anyone have any suggestions, I am using FSE (full screen editor)).

1642. LZH Path

Newsgroup: comp.sys.atari.st
Date: 1991-07-30 14:57:03 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Jul30.145703.24784@actrix.gen.nz>
Source record: 230026

How does one LZH a Folder that is say 3 deep, that also contains
folders, but not to include paths of the 3 folders in the archive.

Sample Path..C:\path1\path2\main\auto\boot.prg
\folder\files.etc
\program.prg

So all the Files and Folders that in Main must be in the
Archive but not \path1\path2\main...

The only way that I have found so far is to copy the contents of
the main folder to disk, then LZH the disk.

Note: the LZH must include folders

Using LZH 1.3 or LZH1321/200A etc..

Good lord people, if your going to spend 3 G's on a home computer why not get one that is REALLY AWESOME and has a 040 in it?

You guessed it, NeXT! You get a nice UNIX, nice apps, AWESOME DISPLAY, AWESOME memory, VIRTUAL MEMORY TO BOOT TOO!!!

I wouldn't consider a TT unless you could get it at developers prices, as REGULAR RETAIL price.

TT is just not that great, hardware wise. Although if you have never had anything else, and just upgraded from a ST...then I suppose it would be great.

It would be a great computer if the price was realistic, considering what you get.

But it just isn't.

From: kbad@atari.UUCP
Message-ID: <3006@atari.UUCP>
Source record: 230038

jimomura@lsuc.on.ca (Jim Omura) writes:

| I moved the 'main()' from the bottom of the source code to my normal
| location just under the globals (the "top" of the program) and it failed
| to compile.

I tried this with the current beta distribution of Lattice C TT (5.08),
with the default command-line compiler settings (which means that strict
ANSI conformance is turned off) and got the following results:

Moving main to the top of wtest.c I got 3 ERRORS for each of the
functions called by main(), "external item attribute mismatch." This
is what I'd expect to see with an implicit function declaration where
the function is later declared with a void return. The compile failed
because of the declaration mismatch.

Declaring each of the functions called by main as returning int,
I got 3 WARNINGS, and the output program worked fine.

I don't know if this is a problem with the 5.04 Lattice version, but
the current version works as one would expect, treating implicit
declarations as required by the ANSI spec.

I seem to remember one "old-style" or "K&R" switch in the compiler
that had problems. You probably shouldn't use that switch. If you're
dealing with old-style code, there are lots of switches you can use to
customize the error handling and reporting of the Lattice compiler.
It's probably worth your while to take a look at the switch summary
in the back of Vol 1 of the manual and check the ones that look useful
to you.

(Jim Omura mentions a fatal Lattice C link-time error that's giving
him headaches)

If you'd be a little more specific about the error the compiler's
giving you, I could probably help... I use Lattice for my C programming
these days, and have run into mysterious things similar to what you
described. Usually the solution involved diddling the plethora of
compiler & linker options until I came up with the right combination.

Yea, but even so, its still rather clumsy. Think about the work needed to
copy a file from your floppy to the hard drive. The above is needed, because
(usually), you cant open a window onto the floppy. You could create a
folder called Floppy, and use Preferences to set path to A:, but thats
still awfully clumsy. And why press a keyboard key when using a mouse?
Isnt that the point of a GUI? Windows may be prettier than GEM, but
its _real_ easy to get things done, IMHO

>definitive one to use?
>
>Bob Malay
OK, Bob, I was going to write you personally, but I think this
is valid for all Spectre users: Access PC. This is a program
from Insignia Solutions that lets you access msdos (and hence,
ST) disks while in Mac mode! No need to transfer files...just
work on your ST or msdos disk while in Mac mode. I just
discovered this myself recently and find it to work
fantastically. The program costs about $60-$65 mail order.
The one problem (not really a problem, but an
inconvenience) is that while Access PC can access MSDOS hard
drives and syquest drives on a 'real' Mac, it cannot do this
under Spectre, since Spectre does not recognize scsi! ***Why
can't this be faked out somehow for this use?*** Wouldn't it
be great to use your ST syquest cartridge while in Spectre?
Anyway, I still find it a very useful program just accessing
my ST/MSDOS floppies.
I also would recommend MacTools Deluxe. Good disk recovery
program AND you can use the backup, once you format your hard
disks from within Mac mode. Disinfectant from mac archives is
a good anti-virus program. WriteNow is a good wordprocessor,
but I find Word4 more powerful for certain things, and Word
still is quite acceptibly fast...WordPerfect 2, however, seems
to have some problems (as you may have seen in my earlier
posts). You're going to need Stuffit, probably, if you want
to get software from ftp sites.
That's about all I can think of now. Maybe we can get Dave
Small to cook up something for AcessPC?
(Bob...I hope to get back to you with the monitor info...)

For the record, I'm using Lattice C version 5.06.02, with the
first edition (Mar. 1990) manuals. As I understand it, the "current
off-the-shelf version" is this compiler, but with the new second
edition manuals. I will be calling Goldleaf shortly to see if I
can get the new manuals.

>it does, it's wrong. My ANSI C spec (admittedly a draft from 10/86) in
>Section 3.3.2.2 (Function Calls) states:
>
> "If no declaration is in scope for an identifier used as the first

>containing the function call, the declaration
>
> extern int identifier();
>
>appeared."
>
>Thus, the behavior is not "implementation defined" but very specifically
>defined by the spec.
>

I think it's worth it for me to go over what I think is the
situation for people thinking about buying a Lattice C compiler.

First, the compiler has a dizzing array of switching combinations.
I won't bother trying to summarize them all, but the relevant switches
are as follows:

-c This switch takes 16 different modifying "subswitches". When
this switch is NOT used, "[T]he compiler defaults to compatibility
with previous releases with many ANSI C language features ... " Note
that the default case is NOT full ANSI compatibility mode.

Now, for full ANSI compatibility you use "-ca". Furthermore
"-caf" will give full ANSI compatibility and make function prototypes
necessary in ALL cases. If you want to make function prototypes
necessary, but WITHOUT full ANSI compatibility, then you can use "-cf".

But there are more dialect variations: "-cl" " ... allows a
pre-ANSI language dialect." What are the characteristics of this
dialect? It's not entirely clear, but I would presume that it refers
to Lattice 3.04 which is covered somewhat in Appendix G in the manual.
But I have NOT found any clear statement to this effect. The appendix
also refers to HiSoft C, so there's some reason to doubt this.

And also there's "-co" which " ... [p]rovides a compatibility
mode to use the pre-ANSI style preprocessor found in previous releases
of the compiler. The most important aspect of this occurs in
substitution of symbols within quoted strings."

-j "This option allows control over the error messages reported by
the compiler. . . ."

Ok, so that's an overview of the problem area I've been concerned
with. I've tried a *lot* of variations and yet have not covered all
the possibilities, but I think I have a feeling for what's going on.

IF you make function prototypes completely necessary, in effect
there isn't any problem. You simply have to have function prototypes
everywhere and if you have them, you get no warnings or error reports.

IF NOT, then IF you have the functions in "bottom up order", all
in the same source code, then again there's no problem. You won't
get any warnings or errors (ok, assuming everything else is right :-).

But if you use a different function definition order, you will
get a WARNING (non-fatal) that the compiler is presuming an "int" is
to be passed. Now, that's not in itself terrible, but what I'm used
to in other compilers is that such warnings only occur where there's
reason to doubt the situation. I would expect to be able to get rid
of the warnings by properly declaring type "int" returns and forcing
dummy values to be returned, or alternatively, by specific casting
of functions as they are used. NEITHER of these approaches will stop
the Lattice C compiler from issueing these clearly unnecessary warning.
Thus they are clutter and make it difficult to isolate important warning.

There are 2 methods to get rid of the warnings. First is to
use the "-j" switch to stop *all* warnings of this type. That's
not really great because you might want these warnings in appropriate
cases. The other alternative is to make your function declarations.

So what it boils down to is that despite all those variations
of switching, you might as well just stick in function prototypes
all over the place anyway. But there's really nothing *wrong* with
the compiler per se. At least not in regard to this problem.

chuj@spot.Colorado.EDU (CHU JEFFREY) writes:

>I was wondering does blackouts have the same effect or any effect on the
>hardware as do surges?

The effect is generally no different than pulling the plug (which is a
no-no with digital equipment because you never know what it will do for
that split-second when it can't tell a 1 from a 0...disk drives are most
vulnerable here (not to hardware damage, but to data-damage).

HOWEVER, when the power comes back on, there is generally a surge, and yes,
your surge-protector will help. I generally turn off all the equipment
during a power-outage, and turn it back on only after the power has been
on steady for 10 minutes. I have a UPS*, so I rarely have to shut down,
and I can always do so gracefully.

>Of course I do have a surge protector, but it probably didn't help any
>in this situation. I might just be paranoid about this, but I'm just
>cautious about my cpus.

Yeah, it's paranoia, but it's healthy paranoia. :-) Some paranoids have
real enemies. Atari blamed the death of my first color monitor on "not
having a surge protector."

Cheers!

Good luck. Many people have been asking this same question for years. Atari considers this kind of specific information a very close guarded secret. There have been some general continent figures and some very good guesstimates--but I don't know them.

Hello ATARI community !

I'm looking for somebody who have a ATARI ST, Mega ST or whatever
with TOS 1.4 in ROM. If you have this version of ROM, please tell me !
I have written a very simple program to dump the content of the ROM
onto a floppy disk.

If you agree to help me I will send you a floppy containing this small
program, you will just have to run it (it takes 30 senconds to complete)
and send the floppy back to me (or may be transfer it via network).

My eternal thanks to anybody who could help me !

Laurent JULLIARD
laurent@hpgnzeus.grenoble.hp.com

And don't forget about NOW utilities!!! Awesome set of inits that
are absolutely nessacary to get the most out of the MAC experience.

The only good system I use or can use, with my MEGA STE, thats stable
is 6.0.4.

Although I hope to run 6.0.5 when Mr. Small upgrades his software for
the MEGA STE's and stuff.

Compact Pro is also pretty nice.

Have fun!

Chirs, there is an init called "LazyMenu", that does this. However, it does not work with Multifinder OR the init called "Windows". I used to have it, but then lost it. It is very old, so finding it could be hard. Since you have the 128, not the GCR, you should try Access PC, I think it works with the 128 (Spectre 3.0 or higher software version is necessary). This would allow you to transfer without Transverter.

Also of note (and this is why I posted this when I answered it), I was recently playing around with a new formatter TLCformat (I think), when trying to find a faster DOS compatible format that would work with Access PC (by the way, none of them will, just the standard 9 sector, 80 track, non-twister, non-FAST disk format will work with Access PC). When I stuck the 720K FAST format disk (faster than Twister but can't use 10 sectors per track) in the drive in Mac mode, it read, and came up as A SPECTRE FORMAT DISK (only with 720K, not 800). This is pretty exciting. However, it also lost the file I had written to the disk in ST mode, and I have not tried it since. It looks like it may be possible to get a format that reads in ST and Mac mode without either Transverter or Access PC. Has anyone else experienced this?

>current as libolb71, but then again it is mint-ized. and what relation
>to "official" gnu.olb are these, version number-wise?

They're very similar -- bammi has been sending me the upgrades to the gcc library, and I've applied most of the patches to the MiNT library (where appropriate). I would say that mntolb10 is roughly equivalent to patchlevel 70 of the library. There are two major differences:

(1) The MiNT library does *not* support UNIXMODE long file names and symbolic links, because these things properly belong in the kernel. UNIXMODE is a terrible hack (I can say that because I invented it :-(). Moreover, UNIXMODE needs to be turned off when you have special MiNT file systems like the minix compatible ones, anyway.

(2) The MiNT library, obviously, provides support for MiNT as well as for TOS. So, for example, if you call sleep() from mntolb and MiNT is running, then the process will go to sleep nicely instead of sitting in a busy loop.

> if i go with
>mntolb versions, is is safe to use the includes and .olb's from mint
>and trash the libolb versions?

Yes, and I would recommend doing that if you're running MiNT. The include files are not completely compatible, so be careful to use the "right" ones with whatever .olb's you pick.

> are there any problems with gcc 1.40
>and gas 1.37 and ld 71 (i think), what i have now, with the latest
>(version 10) mntolb?

None that I've heard of.

>one more thing: will uniterm 2.0a run under mint? if not, will 2.0e?

2.0e certainly will; I presume that 2.0a will as well.

>heck, one more thing: how does gcc 1.40 support floating point now?
>is pml incorporated into gnu.olb now? do i need pml.olb? i tried a
>small project (a simple calculator entirely in yacc - which went thru
>bison and gcc without a hitch) and did nothing special to compile
>(i.e. no "-lpml" or whatever). it worked fine.

Floating point add/subtract/multiply/divide is in gnu.olb; however,
more complicated stuff like sqrt, sin, cos, etc. is in pml.olb.

1667. an idea for Double Click Software, regarding STe problems

Newsgroup: comp.sys.atari.st
Date: 1991-07-31 14:55:00 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1991Jul31.145500.13126@gmuvax2.gmu.edu>
Source record: 230046

Given the number of people that seem to be having problems with the new STe machines, how about coming up with a quick, boot-time diagnostics program, which would simply check to make sure all devices are responding correctly, that the CPU seems to be running okay (how, I don't know), putting a few easily disting-uishable, recognizable sounds through the speaker, and dumping some random pattern to the screen, using as many colors as possible.

It might also help people notice if their machines start to cop out. Catch it before it gets really bad I guess.

Just a thought.

Thanks for your post, David. The more people using Spectre
that use Access PC, the better....I'm hoping that Insignia
and/or Dave Small will somehow get AccessPC to access MSDOS
hard disks via Spectre. I still think it would be great to
use my syquest cartridge with mac and st partitions under
Spectre!
First of all, ye
First of all...yes, AccessPC works with non-gcr Spectre...and
yes, you need Spectre 3.0 software.
Second...I experienced a similar problem with floppies being
read as Spectre formatted disks. I've been using Verbatim ibm
pre-format disks. At first they have been OK, but with a
couple of them, after a while they showed up as Spectre
formatted disks...then they got all messed up and I had to
reformat them again. I think I tried a twister-formatted disk
at one point, although I'm not sure, and it showed up as a
Spectre-formatted disk. When I saw dos and twister disks
showing up differently, I tried to stick to dos-formatted
disks. But now that you mention it, I'll try to play with
other formats and see what happens.
Just so that something may come of it, I'll just mention how
nice it would be to have Access PC access msdos and st hard
disk partitions from Spectre (how do I send Dave Small email
on internet again?)

> \folder\files.etc
> \program.prg
>
>So all the Files and Folders that in Main must be in the
>Archive but not \path1\path2\main...

Try it like this:
(if you're using lha from the desktop, you must strip the leading
'lha.ttp'.)
lha.ttp a -r example.lzh c:\path1\path2\main\ *.*
^
Be aware of that space! By setting this space, you set the so called
"archiver base directory". Now Lharc behaves as if the folders "auto" and
"folder" and the file programm.prg are in the base directory. When using
the above command, LHarc will still show the full path while compressing
(at least 2.01b does), but things look different within the archive.
When calling Lharc with "lha.ttp v example.lzh", you'll get:

AUTO\BOOT.PRG
FOLDER\FILES.ETC
PROGRAM.PRG

I think that what you wanted, isn't it? Eh, I should add that you can not
use LHarc "archive base directory" feature from any LZH Shell if seen
until now. So you've got to do it from the desktop or any cli. If you're
using Gemini, don't forget to quote the *.*....

>WP doesn't simply override that and return to the original
>system font when it loads.
>Does anybody have any ideas?

Probably WP uses the built-in ROM font of the TOS. That means, that WP uses
lina a routines for text output (booh!!!). I can't check it, I don't have WP.

If that ist true, you can use two font manipulators to change the ROM-font.
The size of the font will be the same, but you may load an IBM compatible font
for example. You would have to adapt your printer drivers by yourself.
No. 1 ist FontEdit by D.Woitha (Germany), which is nice and short. It allows to
edit and change only the system font.
No. 2 is Multifont PD by myself, available for example on PD 2000 series 2240
(german version), which can do a lot more (except editing), and therefore has
a size of ~38 kB.
If you want to have Multifont PD, you may send me 10 DM or 10 US$ and I'll
send you a copy on a 3.5'' disk. I will also add FontEdit.

>

Well, I think you can do that via Multidesk. But I believe there is
a shareware DC program (rats, what's the name of it, Mike?) that lets
you have up to like 32 ACC's loaded in, and a commercial version
which lets you have an unlimited supply I believe. It's just what
you seem to need...

Robert Anisko
rjast1@unix.cis.pitt.edu

BTW the shareware version works with MOST ACC's, I've only run into
1 or 2 trouble ACC's that want a regular place in the ACC area...

>
> Thanks for your help
>
> Drew

There is a Good reason why the Font Editor is a ACC, it so you can change
fonts even when Calamus is loaded..

Why do you need 6 ACC loaded all at once, Please explain ??

Do you use a Bootup utill like Desk Manager 33, this will let you select
the TSR's and ACC that you need at bootup for each application
that you wish to run, but note, only at bootup.

If you do need more that 6 ACC, then get Codeheads MultiDesk and
the Hotwire program, Hotwire can call MultiDesk as a application
and install all the ACC that you need for a given Application
with just a press of a key and at any time, not just at bootup

IE, Hotwire gives you Hot Keys that can install all the ACC's needed
for that Application and Install the program that you wish to run
and load the document as well, all from one key press.

Note: I don't work for Codehead..but I do think that they produce
some good accessary programs and utilities..

>
> Martin Gaeckler

Turbo-C has been licensed to Gribniff Software (i.e; NeoDesk, etc...)
in the U.S. I should know...It ran me $280.00 for the Professional pack
which includes the MAS-68k assembler and Turbo-DEBUGGER* .

I don't have the number, but I believe if you call 617-555-1212 you can get
the number--They're in Hadley, Massachusetts.

* The debugger is the most awesome interactive debugger I have ever seen on
an ST. It reminds me a great deal of a "windowing" VAX-VMS debugger
with "real-time" updating of information in windows.....Also, I've had
at least 12 windows open at the same time and I have TOS 1.2--So I don't
think they're using GEM either.
With TD, you can have the SOURCE, ASSEMBLY, VARIABLES, STACK, etc...
all visible so you can see what your program is doing AS it does it--you
have variable step rates...

My 1040 has a Tech Specialties upgrade board in it which brings my memory up to 2.5 meg. However, I got no documentation on the board when I bought the computer, so I was wondering...

Does the lithium battery attached to the board indicate that is has a clock? If so, how do I access the time off of it?

Exactly what sort of soldering is necessary to bring it up to 4 meg? I have the chips, and the sockets are on the board, but I know it's not just as simple as plugging in the chips and getting 4 meg.

Any spare documentation or info E-mailed to me would be eternally appreciated.

Ian

The nicest (IMHO) is called UNLZH172.ARC. It only extracts files, but it does it fast and is friendly (I only wish there was a "delete lzh after extract" option. One really nice feature is that you can automatically have it create a folder and extract into it. It can be installed as an application, so a double click on an .lzh file is all that is needed.

Try Chameleon, it only loads one at a time, but lets you dump and load from desk any single DA you wish at any time, during any program etc... It takes up one slot, and will automatically load whichever DA is called CONTROL.ACX. So if you want your control panel to remain in memory all the time, then rename it to something else. Or, if you never want your control panel but want some other DA to default to that slot, then rename some other DA to CONTROL.ACX. I renamed NOTEPAD and now when the system boots up I get my five best DA's in permanent menus, plus NOTEPAD in the chameleon menu. So when I need another DA (I use this for Fontedit all the time by the way), I hold down shit-alt, pull down CHAMELEON (which unloads NOTEPAD), and then load whatever else I want. This works 100% of the time and has never crashed with any DA I have ever tried. This is far from true with the other DA-Extension type of programs I have used.

GOOD LUCK

Right you are, put a voltage-output dac of your choice on the printer port
d0 to d0, d1 to d1 and so on... Feed it 5 volts, and direct the output from
the dac to your stereo. When you have lisend to it for 5 minutes you to make
a RC low pass filter - and then you realize how good the filters in the STe
and TT's are!

Source record: 229861

My paranoia got severe enough that I bought a Tripp power
>>conditioner<<. I am very pleased with the device so far. Here in
Naperville, Il. we are known for crummy power. There are several
versions of their power conditioners. The smallest and cheapest is a
600 watt model, then there is 1200 watt and 1800 watt models.

I went for the 1200 watt model because it will handle low and high
voltage. The 600 watt model will only handle one of them (I forgot
which.) This device not only protects the equipment from surge, etc.
but delivers clean 120V when the input voltage is anywhere from around
80V to 140V.

The cost is somewhere around $150. I believe it a very useful
investment for several thousand dollars worth of equipment.

1691. Jukebox update

Newsgroup: comp.sys.atari.st
Date: 1991-08-01 17:02:27 UTC
From: micro@imada.ou.dk
Message-ID: <1991Aug1.170227.24076@imada.ou.dk>
Source record: 229869

The same day I send 'The Jukebox' to atari.archive, I found a bug in the player module, so I decided to lend an friends STe and do some serious debugging.
The old version had a bug the double buffering, this bug gave some real annoying clicks.
The new version is many times faster than the old one! (with 8 players that is choosen dynamically to give shortest possible convertion time)
It is now possible to do something on the computer (@8MHz), while it is playing with 1. order interpolation @6.25KHz in the background, or without interpolation (0. order to be honest) @25KHz.

I expect the new version to replace the old one in the atari/ste directory @ atari.archive.

(The program *should* work on the TT, can someone verify this?)

How do I tell my friend (who is on vacation and don't know that I lend his STe) that his STe have the Harddisc DMA problem? (his STe trashed my Source partision).
Will Atari replace the faulty chip?

-Klaus

I'm surprised that amid this discussion of multi-DA loaders, no one has pointed out that Atari's new (and free) XCONTROL control panel provides access to a multitude of utilities while taking up only one DA slot.

The new control panel actually is a manager for CPX (Control Panel eXtension) modules. The XCONTROL package includes several CPX modules, and more are being made available.

CPX modules can be either memory-resident or loaded from disk on demand -- you configure the system to your liking.

A CPX module can be used in any case where direct, full-time access to GEM's pseudomultitasking isn't needed. (That's actually the case with most currently available ACCs, which simply call evnt_mesag() and wait for a wakeup call from GEM indicating that their menu entry has been clicked.)

To use a CPX module, you click on XCONTROL's menu entry. This provides you with a scrolling menu of icons that can be selected to activate any CPX modules that you have available on your system. The CPX module you select then runs atop the current GEM application, just like any desk accessory.

1693. Laser C source level debugger

Newsgroup: comp.sys.atari.st
Date: 1991-08-01 20:07:57 UTC
From: jharres@sleepy.bmd.trw.com
Message-ID: <1702.289807ad@sleepy.bmd.trw.com>
Source record: 229877

I am using Laser C for software development and am considering buying their source level debugger. So, a few questions:
1. Is it worth $49?

2. Does it have seperate source and program output windows?

3. Is it a true source level debugger (or just a claim)?

4. Are there any better ones available (that work with Laser C)?

5. Is Megamax still out there?

Any other comments are also welcome.

Along the Turbo C or PureC thread:
1. Is PureC to be available in the US?

2. Cost in US $.

Thanks for the help

From: timm@sol.cs.uni-sb.de
Message-ID: <12219@sbsvax.cs.uni-sb.de>
Source record: 229872

Hello,

I just managed to compile C++2LaTeX (Version 1.1) with GCC 1.39 for the atari st. C++2LaTeX is a program written by Norbert Kiesel (norbert@rwthi3.informatik.rwth-aachen.de), which converts C++-Programs (or ANSI-C if you specify that by a command-line option) into a "pretty-printed" LaTeX file. The sources are available at ftp.uni-koeln.de (134.95.80.1). To compile them i just had to comment-out one line (#include <malloc.h>).

Ok, if anyone is interested and has problems to build it himself, i could post the binary or upload it to atari.archive.

Since the ST is so popular over in Germany, maybe this isn't too unusual a request.

I'm looking for a computerized version of the game Sheepshead (or Schafskopf in German) which is popular in the Milwaukee area, but not too widely known in the rest of the U.S. I've seen it for the IBM PCs, but never an Atari version. If anyone knows of a public domain or commercial version of this game, please let me know.

Thanks.

As far as cleaning the contacts on your chips - if you are VERY
careful, I've found that a pencil eraser works very well in removing
the oxidation that causes bad connections. Hold your finger in between
the pins on each side, though, so they won't bend.

Speaking of media shows, were there any Atari ads in conjunction with the Tour de France? The cyclists are attired like colorful billboards and it would have been a great promotion for Atari France; the Tour becomes of intense focus for three weeks and 2000 miles of travel thru pretty Spanish, Italian and French countryside.

Motorola certainly gained a lot of publicity when Australian Phil Anderson of Team Motorola took advantage of the aid from his Swiss, Norwegian, British, Canadian and American teammates, by sprinting victoriously in stage 10. The international representation within the teams corresponds well to a company with global interests like Motorola, Toshiba or Atari. The drawback is that supporting a team is expensive, so it might be necessary for Atari to get a co-sponsor. Most appropriate would seem to be the Fuji Bicycle Company. :-)

people: can we lay this lzh business to rest one and for all:
now that zoo 2.1 is out and posted to comp.[binaries|sources].a.s

-- its high compression is atleast as good as anything else out
there.
-- it is reasonably fast for extraction, compression speed needs some
work, which is happening.
-- it comes complete with sources, and runs on any reasonable
machine.
-- it is totally backwards compatible. unlike various versions of
lzh.
-- the St version does recursive directory decent, regular expression
globbing etc, in addition to all the features for standard zoo.
-- i am sure someone will conjure up a graphical shell for it, for
people averse to cli's.

cheers,

Yes, and more.

> 2. Does it have seperate source and program output windows?
Yes, it uses a seperate screen for the program window.

> 3. Is it a true source level debugger (or just a claim)?

Well, you see the source, just like you wrote it, and step
through it line by line. Can't modify the source in it though.

> 4. Are there any better ones available (that work with Laser C)?

No.

> 5. Is Megamax still out there?

Yes, though they don't appear very active in the market anymore.
Hard to really tell though, as there's really nowhere to advertise
anymore.

>Any other comments are also welcome.

Laser C's debugger works in color, which is one of the reason's I
won't be switching to Turbo C in the near future. You need Laser C 2.1 or
higher to use the debugger, and 2.2 or higher to work with Tos 1.4. The
2.2 shell is still crash-prone though, and I recommend using a command
shell instead.

I use my TT with an Atari TTM195 mono 1280x960 monitor; however, for the first few months I had been using an Atari PTC1424 colour monitor. The guys in the next office have Compaq 386sx systems (real dogs!) and on occasion, I have borrowed thir NEC 3D monitors since I no longer have the PTC1424. The honest truth is, the PTC1424 is FAR better than the NEC 3D. So, when thinking of a colour monitor for the TT, why not consider Atari's own PTC1424?

You may patch the name of the default ACC in the Chameleon binaries.
Just look for the string C:\CONTROL.ACX and replace it with whatever
you want. You may even load an ACC from anonther drive and/or folder.

It's really easy to do so: use a command line shell and set an alias to your
lharc, cd to \path1\path2\main and type lharc a -r arcname
When you dont use a shell, open a second window in which the lharc appears,
make the window with path1\path2\main in it be the top window, start lharc
by double click _while holding down the right mouse button_, and type the
above command line.

1708. Jove Wanted for ST

Newsgroup: comp.sys.atari.st
Date: 1991-08-02 13:04:34 UTC
From: Bill_von_Hagen@TRANSARC.COM
Message-ID: <UcaJVWD0BwwuI=JD0w@transarc.com>
Source record: 229884

I'm looking for an emacs clone with command completion. Gnu emacs is just too big! MicroEmacs doesn't seem to like either of the software blitters I use, and I don't know if it supports command completion nowadays. MicroGnu emacs doesn't offer command completion. I've been told that a port of Jove exists for the ST. Could anyone send me a pointer to it, or perhaps just send it to atari.archive.umich.edu?

Any suggestions other than the emacs clones I've named?

Thanks very much!!

Bill (wvh@transarc.com)

1709. Re: Idea for a program (maybe DC?)

You just have to use the 'df' command of any shell.

1711. ZOO 2.1, BUG, or is it me.....

Newsgroup: comp.sys.atari.st
Date: 1991-08-02 16:08:30 UTC
From: alanh@logitek.co.uk
Message-ID: <alanh.681149310@krypton>
Source record: 229890

The recent posting of Zoo 2.1 in comp.binaries.atari.st, works fine for me bar one thing......Explanation follows....

Command:

zoo ah// archive archive\

Where ah is add and high compression, // is full pathname add...

If the directory structure ends in a letter all is fine...

Everyone try this..

zoo ah// archive1 archive1\

Where the name ends in a number...

Well, I get a bus error every time. I am using TOS 1.0, so this could be a problem, but anybody willing to comment...

Alan Hourihane

1712. v16INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-08-02 16:24:53 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <677@appserv.Eng.Sun.COM>
Source record: 229893
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 16, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@twitterpater.eng.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@twitterpater.eng.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!twitterpater.eng!atari-binaries. Note that
comp.binaries.atari.st is not the correct place to ask general questions
or to ask, "Does anyone have software that does X?" Post such requests to
comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Please include a description of your program at the top of your article.
Look at old issues of comp.binaries.atari.st for examples of the sorts
of descriptions I'm looking for. I don't write the descriptions at the
tops of the articles; what you see is what the submitters gave me.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this means
```

arc, zoo (including 2.1), and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v16INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v16i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 16. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v16i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
zoo-high - program is a zoo 2.1 high-compression archive (zoo21 req'd)
lharc - program is an lharc archive (lharc required to unpack)

high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 16, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

1713. v16INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1991-08-02 16:25:23 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <678@appserv.Eng.Sun.COM>
Source record: 229891
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 16, Info 2
Archive-name: Index

Files listed below can be requested from the Atari archive server,
archive-server@twitterpater.eng.sun.com. Send it a mail message containing
the word "help" for information.

Note: When requesting files from the archive server, replace the last "/" in
a file's path with a space, e.g. volume1/turtle part01. You may request
several files from the same directory (volume1/turtle part01 part02 part03).

Note: When requesting files from the archive server, replace the last "/" in
a file's path with a space, i.e. volume1/turtle part01. You may request
several files from the same directory (volume1/turtle part01 part02 part03).

volume10/gemini1.1/part01 Version 1.1 of Gemini desktop (in German)
volume10/gemini1.1/part02
volume10/gemini1.1/part03
volume10/gemini1.1/part04
volume10/gemini1.1/part05
volume10/gemini1.1/part06
volume10/gemini1.1/part07
volume10/gemini1.1/part08
volume10/gemini1.1/part09
volume10/gemini1.1/part10
volume10/gemini1.1/part11
volume10/gemini1.1/part12
volume10/antibomb Replace bombs with a text dialog box
volume10/mastdemo/part01 Demo of command-line shell
volume10/mastdemo/part02
volume10/mastdemo/part03
volume10/mastdemo/part04
volume10/mastdemo/part05
volume10/mastdemo/part06
volume10/mastdemo/part07
volume10/catch Catch control-Z and control-C under Master
volume10/play/part01 Play digitized sounds
volume10/play/part02
volume10/play/part03
volume10/minibbs29.3/part01 Bulletin-board software
volume10/minibbs29.3/part02
volume10/xxed11 Version 1.1 of xxed hex editor
volume10/rsutil/part01 Convert GEM rsc files from PC <-> ST
volume10/rsutil/part02
volume10/rsutil/part03
volume10/rsutil/part04
volume10/rsutil/part05
volume10/rsutil/part06
volume10/nsyscom Trace system calls
volume10/nmentim Put time and date in menu bar
volume10/dcshow11 DC-ShowIt 1.1 -- replace Desktop file viewer
volume10/dcdesk/part01 Demo of DC Desktop -- enhance the GEM desktop
volume10/dcdesk/part02
volume10/dcdesk/part03
volume10/dcdesk/part04
volume10/dcdesk/part05

-- VOLUME 11 --

volume11/mystic Format floppies in the background
volume11/chcache Disk cache
volume11/quickcis/part01 CompuServe navigator
volume11/quickcis/part02
volume11/quickcis/part03
volume11/dcreafix Fix for a bug in Dcreate()
volume11/fgrep GNU fgrep -- search for strings

volume11/desktop1/part01 Change desktop backgrounds
volume11/desktop1/part02
volume11/mkrsc/part01 Resource construction program
volume11/mkrsc/part02
volume11/grep/part01 GNU grep and egrep
volume11/grep/part02
volume11/grep/part03
volume11/xpoolfix Fix a TOS 1.4 bug (NOT an official patch from Atari)
volume11/bomb Explain system errors
volume11/dviatari/part01 DVI previewer
volume11/dviatari/part02
volume11/dviatari/part03
volume11/sunclock A clock program...
volume11/geminiuk/part01 Gemini desktop replacement v 1.1 (English)
volume11/geminiuk/part02
volume11/geminiuk/part03
volume11/geminiuk/part04
volume11/geminiuk/part05
volume11/geminiuk/part06
volume11/mvdist/part01 GEMINI's shells (mupfel and venus)
volume11/mvdist/part02
volume11/mvdist/part03
volume11/mvdist/part04
volume11/altboot Select AUTO-folder programs/accs at bootup
volume11/nsyscom2 See GEMDOS/BIOS/XBIOS calls
volume11/aimps Convert AIM pictures to PostScript
volume11/patchtst Patch Turbo-ST 1.8 to work with DC Desktop
volume11/beep Replace bell with any sampled sound
volume11/click/part01 Replace keyclick with digitized sounds
volume11/click/part02
volume11/mines Game: get across a minefield
volume11/play/part01 Play digitized sounds
volume11/play/part02
volume11/play/part03
volume11/play/part04
volume11/ntplay Listen to Amiga Noisetracker/Soundtracker modules
volume11/belltest Belltest 2.0 -- test NewBell bell sounds
volume11/st_conc Concentration game
volume11/norad/part01 NORAD (satellite tracker) version 2
volume11/norad/part02
volume11/norad/part03
volume11/cmd Command line interpreter
volume11/pstfonts/part01 Three new fonts for PageStream
volume11/pstfonts/part02
volume11/pstfonts/part03
volume11/pstfonts/part04
volume11/pstfonts/part05
volume11/altboot3 Change auto-folder configuration, version 3
volume11/rhokontd Enhanced control panel (in German)
volume11/fastlife Game of life (not really fast)

volume11/sunclock2 Sunclock version 2 (WITH the .RSC file!)
volume11/djon DeskJet reset program
volume11/lharc1.02/part01 LHArc derived from UNIX version
volume11/lharc1.02/part02
volume11/coloremu Low-resolution emulator for mono systems
volume11/mediumem Medium-resolution emulator for mono systems
volume11/monoemu Monochrome emulator for color systems
volume11/meep Utility package for BBS-Express ST
volume11/mines Game of mines for monochrome systems
volume11/plot/part01 Function/data plotting package
volume11/plot/part02
volume11/plot/part03
volume11/dskswtch Load new DESKTOP.INF files without rebooting
volume11/switcher Pick random NeoDesk/DegaDesk pics, NewBell sounds
volume11/monoemu2 Another monochrome emulator
volume11/lgs1.7/part01 Little Green Selector file selector replacement, v. 1.7
volume11/lgs1.7/part02
volume11/dcopy3.6/part01 General disk utility
volume11/dcopy3.6/part02
volume11/stevie3.91/part01 vi editor clone, v. 3.91
volume11/stevie3.91/part02
volume11/stevie3.91/part03
volume11/maze Walk through a maze in 3-D
volume11/siren Sound an alarm to keep you awake
volume11/pinhead PinHead 1.7 -- speed up program loading
volume11/sunclock3 Another version of sunclock
volume11/nroff110/part01 Nroff clone, version 1.10
volume11/nroff110/part02
volume11/nroff110/part03
volume11/nroff110/part04
volume11/pi1tomon Display .PI1 pictures on a mono monitor
volume11/gulwrap Make Gulam work under Gemini
volume11/dublvis Format DS disks that work in SS drives
volume11/nrchbar Generate change bars for nroff files
volume11/sndshow3 Show DEGAS pictures on any kind of monitor
volume11/viewpic2 View a DEGAS picture on any monitor
volume11/mspeed Tiny mouse accelerator
volume11/rt_move Move files with right mouse button (TOS 1.4)
volume11/xmore Configurable "more" for various file types
volume11/mutate Disk sector editor
volume11/xxxx Insert numbers into files

-- VOLUME 12 --

volume12/arcgsh3/part01 Graphical shell for arc, lharc, zoo, shar
volume12/arcgsh3/part02
volume12/arcgsh3/part03
volume12/arcgsh3/part04
volume12/cat2asc Convert STDCAT43 catalogs to pretty ASCII form
volume12/arcgsh31/part01 Graphical shell for zoo, arc, lharc, etc.
volume12/arcgsh31/part02

volume12/arcgsh31/part03
volume12/arcgsh31/part04
volume12/mshadow Convert disks into files for modem transmission
volume12/showdvi1.0/part01 Show DVI files onscreen
volume12/showdvi1.0/part02
volume12/showdvi1.0/part03
volume12/showdvi1.0/part04
volume12/showdvi1.0/part05
volume12/tortoise Helper for TURTLE under TOS 1.4
volume12/stturing Two-dimensional Turing machine
volume12/format Versatile floppy formatter
volume12/chcache34 Cold Hard disk cache, version 3.4
volume12/mercury/part01 UUCP package w/ mail and news support
volume12/mercury/part02
volume12/mercury/part03
volume12/mercury/part04
volume12/mercury/part05
volume12/mercury/part06
volume12/mercury/part07
volume12/mercury/part08
volume12/mercury/part09
volume12/mercury/part10
volume12/mercury/part11
volume12/mercury/part12
volume12/mercury/part13
volume12/mercury/part14
volume12/hdwboot Wait for hard disk to come online
volume12/mint06/part01 UNIXlike multitasking system
volume12/mint06/part02
volume12/mint06/part03
volume12/mint06/part04
volume12/mint06/part05
volume12/mint06/part06
volume12/mint06/part07
volume12/mint06/part08
volume12/mint06/part09
volume12/mint06/part10
volume12/elvis/part01 vi clone
volume12/elvis/part02
volume12/elvis/part03
volume12/elvis/part04
volume12/meep60 Enhanced menu system for BBS Express
volume12/mapmem Show info about XBRA vector chains
volume12/steplay Play SoundTracker modules in stereo on STE
volume12/player Play SoundTracker modules on a regular ST
volume12/packice Shrink executable programs
volume12/dirsort Change directory ordering
volume12/rhoconte Enhanced control panel (in English)
volume12/sysmon/part01 System monitor program
volume12/sysmon/part02

volume12/sysmon/part03
volume12/sysmon/part04
volume12/bgacc Desk acc. to run background jobs under MiNT
volume12/32kcolor Instructions for modifying ST to show 32768 colors
volume12/fcat Fast "cat" for Gulam
volume12/arcgsh32/part01 Graphical arc/zoo/lharc/etc. shell, 3.2
volume12/arcgsh32/part02
volume12/arcgsh32/part03
volume12/arcgsh32/part04
volume12/fcat11 Fast "cat" for Gulam
volume12/cdecl/part01 Generate C declarations
volume12/cdecl/part02
volume12/djstuff DeskJet configuration utilities
volume12/n_fat Cache FAT sectors in RAM
volume12/eplay20 STe sound sample player
volume12/etext Filter ASCII files into PageStream format
volume12/lifeuniv GEM-based game of Life
volume12/pfx LHArc-compatible executable shrinker
volume12/stblank1.31 Screen-blanking desk accessory
volume12/sbj Blackjack game for multiple players
volume12/timedrv5 Time/drive display + screen saver
volume12/settdfix Fix bug in date-setting program in PC Ditto II
volume12/xlisp2-1/part01 LISP interpreter, v 2.1
volume12/xlisp2-1/part02
volume12/xlisp2-1/part03
volume12/hd_falc5 Boot Falcon from a hard disk
volume12/hdiskcht Show a chart of free disk space
volume12/ptywin/part01 PTY driver for Micro RTX
volume12/ptywin/part02
volume12/lgs_18b/part01 Little Green Selector (replaces GEM file selector)
volume12/lgs_18b/part02
volume12/pinhed18 Speed up program loading, v 1.8
volume12/perfpich Pitch training for MIDI users
volume12/edisk21 Resetproof, resizable RAMdisk
volume12/easytext/part01 Demo of Easy Text desktop publishing system
volume12/easytext/part02
volume12/easytext/part03
volume12/gnum4/part01 GNU "m4" macro processor, v 0.50
volume12/gnum4/part02

-- VOLUME 13 --

volume13/minibbs25/part01 Bulletin board system, v 2.5
volume13/minibbs25/part02
volume13/mkrsc/part01 Resource construction program
volume13/mkrsc/part02
volume13/arcgsh35/part01 Graphical shell for arc/zoo/lharc, v 3.5
volume13/arcgsh35/part02
volume13/arcgsh35/part03
volume13/arcgsh35/part04
volume13/arcgsh35/part05

volume13/cdecl-p1 Generate C declarations, patchlevel 1
volume13/specstuf/part01 Utilities for use with Spectre
volume13/specstuf/part02
volume13/zoobooy Graphic shell for zoo and uue/uud
volume13/mgif GIF viewer for monochrome STs
volume13/gawk211/part01 GNU awk, version 2.11
volume13/gawk211/part02
volume13/gawk211/part03
volume13/gawk211/part04
volume13/printcms Print 132-column VM/CMS listings on Epson FX printer
volume13/auto Three AUTO-folder utilities
volume13/xlharc12/part01 Another version of lharc (based on UNIX lharc 0.03)
volume13/xlharc12/part02
volume13/mapmem2 Show system stats, XBRA vectors
volume13/motasm/part01 Motorola assemblers for 68xx processors
volume13/motasm/part02
volume13/motasm/part03
volume13/maxidisk Resetproof, autocompressing RAMdisk
volume13/lhcatch Make Yoshi's lharc work with ARCshell
volume13/killdrv Add/remove drives from TOS's drive list
volume13/szadb12/part01 Sozobon adb debugger, v 1.2
volume13/szadb12/part02
volume13/mclock Corner clock for mono systems
volume13/minibbs2312/part01 Version 23/12 of MiniBBS
volume13/minibbs2312/part02
volume13/minibbs2312/part03
volume13/mousercv Mouse Recover -- fix missing/mangled mouse pointer
volume13/clikfix Fix TOS 1.4 scrollbar problem
volume13/prolog68.07/part01 Prolog interpreter, v 0.7
volume13/prolog68.07/part02
volume13/prolog68.07/part03
volume13/prolog68.07/part04
volume13/prolog68.07/part05
volume13/mgif11 GIF viewer for mono systems, v 1.1
volume13/dx7lib/part01 Sound library and utilities for Yamaha DX7
volume13/dx7lib/part02
volume13/nlight Show I/O to any disk by flashing floppy light
volume13/nship Parks AHDI-compatible hard disks
volume13/less97/part01 file pager for MiNT
volume13/less97/part02
volume13/less97/part03
volume13/pathalias/part01 Build UUCP paths file from maps
volume13/pathalias/part02
volume13/altbt40e Change AUTO folder/DESKTOP.INF setup at boot time
volume13/10401990 1990 1040 tax form template for LDW Power
volume13/dcmshift Right mouse button activates shift, ctrl, or alt
volume13/rsctoasm Convert .RSC files to assembly source
volume13/dcmaxtrk Tell which tracks a floppy can reach
volume13/lhcatch2 Make ArcShell work with LHarc 1.13xx
volume13/lzh11316 LHarc version 1.13.16

volume13/dvi2tty Plain text dvi previewer
volume13/mercury/part01 Mercury UUCP: mail/news package
volume13/mercury/part02
volume13/mercury/part03
volume13/mercury/part04
volume13/mercury/part05
volume13/mercury/part06
volume13/mercury/part07
volume13/mercury/part08
volume13/mercury/part09
volume13/mercury/part10
volume13/mercury/part11
volume13/nroff110p4/part01 Nroff clone, version 1.10 patchlevel 4
volume13/nroff110p4/part02
volume13/nroff110p4/part03
volume13/nroff110p4/part04
volume13/man Read online manual pages
volume13/manpg14 Pager for reading online manual pages
volume13/manpg141 New manpager executable (requires manpg14)
volume13/dfsuite Three disk utilities
volume13/reset Cold or warm boot via software
volume13/wbplot/part01 2-D plotting package
volume13/wbplot/part02
volume13/umoria522/part01 UMoria single player dungeon adventure, v5.22
volume13/umoria522/part02
volume13/umoria522/part03
volume13/umoria522/part04

volume15/elvis14/part03
volume15/elvis14/part04
volume15/mfd/part01 Find duplicate files
volume15/mfd/part02
volume15/dcpopbar Pop up the desktop menubar menu on right mouse button click
volume15/nmentim Show date and time in a Desk menu entry
volume15/brik Generate and/or check file CRCs
volume15/stlife31/part01 Game of life, version 3.1
volume15/stlife31/part02
volume15/stlife31/part03
volume15/stlife31/part04
volume15/mcp Directory/file copy program
volume15/nmouse Control mouse movement parameters
volume15/dcrtcall Call up file selector with right mouse button
volume15/con Redirect MiNT status info to a window under MGR
volume15/double Double vertical screen resolution on STEs
volume15/traffic Game: direct traffic through busy intersections
volume15/nformat Accessory to format disks in MS-DOS format
volume15/n_fat12 Cache FAT sectors in RAM, version 1.2
volume15/n_capslk Show CapsLock status in menu bar
volume15/dcr_tmag Real-time screen magnifier

volume15/dctopper12 Bring window under cursor to top, version 1.2
volume15/flagsett Set flags in executable file header
volume15/limerick Invent random limericks
volume15/lhx104 Extract from .LZH files
volume15/stzip09/part01 Beta version of PKZip clone, v 0.9
volume15/stzip09/part02
volume15/nasm/part01 6502 assembler/linker package
volume15/nasm/part02
volume15/nasm/part03
volume15/nasm/part04
volume15/nasm/part05
volume15/nasm/part06
volume15/ibmfmt Format MS-DOS compatible floppies
volume15/dc_mwrap Wrap the mouse around when it hits a screen edge
volume15/crabs Screen-eating program for MiNT
volume15/double2 Double vertical screen resolution on STEs, v2
volume15/autorais Raise window under mouse cursor to top
volume15/dmjgif20/part01 GIF-to-Spectrum converter
volume15/dmjgif20/part02
volume15/mgif32 Monochrome GIF viewer, version 3.2
volume15/modplay Play SoundTracker modules on STE
volume15/speed Switch between 8 and 16 MHz
volume15/trakst2 Play/Edit SoundTracker modules on ST
volume15/trakste2 Play/Edit SoundTraker modules on STE (stereo)
volume15/50hz Switch monitor to 50Hz (needed by trakst, trakste)
volume15/nowhat/part01 Sample SoundTracker module for trakst/ste
volume15/nowhat/part02

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: July 28, 1991

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each

other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time

they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site twitterpater.eng.sun.com has all the binaries stored in its archives.

The other way to get binaries is to request them from twitterpater's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you.

Using Binaries -3-

One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@twitterpater.eng.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@twitterpater.eng.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that twitterpater does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Twitterpater also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is point-

less and a waste of net bandwidth. Send mail to autoindex-request@twitterpater.eng.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

_____
|- UNIX is a trademark of Bell Laboratories.

A version of uudecode written in ST BASIC is available in twitterpater's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run

uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the

resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. A new version of zoo, 2.1, is in volume 15 of the binaries archive. You'll need the old version of zoo to unpack the new one. Zoo 2.1 is necessary to unpack "zoo-high" format archives (look at the Keywords: line of the article you're unpacking.)

To extract lharc files, you should first try the program "lhx104" in volume 15 of the comp.binaries.atari.st archives. It's not in compressed form, so all you'll need to do is uudecode the .TTP file. It will unpack .LZH files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

gaudreau @ east.sun.com am Mo, 29.07.91 17:06 in ATARI.ENG

>=PureC is an improved version of TurboC 2.0 - they have improved compiling
>=speed and and the help system, and a new assembler (68000-68040) is
>=included. As an owner of TurboC2.0 ('Profi-Pack' - incl. Source-Level
>=debugger etc.), the update would cost me 150.- DM - I think that's pretty
>=much money for the minor improvements I would get :-(
>
>Could you provide more information on what the update involves/costs/etc.

The Most important improvements of Turbo C to Pure C:
- Debugger will run in all resolutions tha provide at least a 80 * 25 char-
acter screen.
- It will able to debug DAs.
- There will be a new assembler with 68040-, NewLibraryFormat- and Debugger-
Support.
- The IDE provides a better HELP-function. You will find a symbol definition
very fast.

>Is there English documentation [yet] !?!?!?!?

There will be no english documentation. Borland did not allow to translate
the docs.

>Thanx for any help.
Hope this helps.

Greetings

Martin

1716. Minix availibility questions...

Newsgroup: comp.sys.atari.st
Date: 1991-08-02 20:42:12 UTC
From: johnson@dover.dab.ge.com
Message-ID: <1991Aug2.204212.11592@ge-dab.GE.COM>
Source record: 229892

Greetings,

Pardon me if this was beaten to death previously, but can someone clue me in on the Minix operating system? Is it Public Domain or shareware? I seem to remember hearing about a book which included a disk containing Minix for the ST. Has anyone had any experience with Minix on the ST? Would it be worth it to get X Window running under it? How about InterViews? Can regular TOS/GEM applications still be run, or at least, can TOS-format disks and partitions be accessed still?

Thanks!

Christopher Johnson

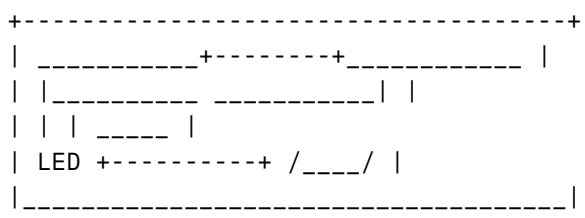
I have a working DS Sony 1" high mechanism removed from an Atari STE.
Perfect for replacing a broken drive. its faceplate looks like this:



I'd like $30 obo, including USPS parcel post shipping, and would
prefer to receive a check in advance, upon receipt of which, I'd ship
the drive.

This drive is capable of reliable 11 sector/track disks.

1718. 1400XL

Newsgroup: comp.sys.atari.st
Date: 1991-08-03 07:50:41 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1991Aug3.075041.29626@sactoh0.sac.ca.us>
Source record: 229898
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The other day, I saw these two interesting items for sale at a computer store, and I have a dew questions.

There were two 1400XL computers, presumably FCC test and/or Atari engineering models for sale. One had a 1450XLD label (It obviously wasn't, no metal case and DS built in drive) and the other had no label. These were 1400XLs, they had the PBI and the modem connections (RJ-11) THey were offering $150 each, and they guy behind the counter grunted they worked.

The other was the 1090 expansion box, with some memory board in it. It had no price.

So, what is the going price for these pieces of Atari trivia? I know that 1450XLDs have value, but a 1400XL? (I'd still like to find an XLD, I'm about one of ten DOS 3 users left on the planet. And DOS 3 was designed for the XLD drive)

By the way, the 1090 box had no cover.

I had heard that Antic (rest in peace) had a 1090 holding a door open...

Anyone know what happened to the other "lost" Ataris, like the 65XEP, 130ST, 65XEM, 121XDM, et al?

You can have more than one Chameleon by having two Chameleon accessories
loaded. Just have the other copy of Chameleon with a different name. For
example, you may have one of them called CHAM1.ACC and the other called
CHAM2.ACC.

I just tried the above example and everthing archives just fine. I am using
TOS 1.4 so I suppose 1.0 could be the problem, but I don't know for sure.
I'll continue testing zoo and see if I can duplicate the problem.

I too am having a minor problem with Zoo 2.1. When I make an archive,
the creation time of the .zoo file is exactly 1 hour later than the
time of the youngest file in the archive. They should be the same.

|>
|>-c This switch takes 16 different modifying "subswitches". When
|> this switch is NOT used, "[T]he compiler defaults to compatibility
|>with previous releases with many ANSI C language features ... " Note
|>that the default case is NOT full ANSI compatibility mode.
|>

Thats more or less correct, the compiler by default sets itself up to
compile programs rather than gratuitously reject them. Again for the
next release, if in non-ANSI mode more things explicitly outlawed by
ANSI will be allowed (like *((char *)x)++ and struct { int size,
var[0];})

|> Now, for full ANSI compatibility you use "-ca". Furthermore
|>"-caf" will give full ANSI compatibility and make function prototypes
|>necessary in ALL cases. If you want to make function prototypes
|>necessary, but WITHOUT full ANSI compatibility, then you can use "-cf".
|>

The current compiler has no fully conformant mode, we have never
claimed it was fully conformant, the next release will be much closer.
That said all of the other compilers have their own areas of
non-conformancy.

|> But there are more dialect variations: "-cl" " ... allows a
|>pre-ANSI language dialect." What are the characteristics of this
|>dialect? It's not entirely clear, but I would presume that it refers
|>to Lattice 3.04 which is covered somewhat in Appendix G in the manual.

|>But I have NOT found any clear statement to this effect. The appendix
|>also refers to HiSoft C, so there's some reason to doubt this.

The -cl option is misdocumented in the manual, I believe the README
file has the correct description which is to align externals on long
word boundaries.

|> And also there's "-co" which " ... [p]rovides a compatibility
|>mode to use the pre-ANSI style preprocessor found in previous releases
|>of the compiler. The most important aspect of this occurs in
|>substitution of symbols within quoted strings."

i.e. perform macros expansion inside quoted strings as per pre-ANSI
compilers.

|>-j "This option allows control over the error messages reported by
| the compiler. . . ."
|>
|> Ok, so that's an overview of the problem area I've been concerned
|>with. I've tried a *lot* of variations and yet have not covered all
|>the possibilities, but I think I have a feeling for what's going on.
|>
|> IF you make function prototypes completely necessary, in effect
|>there isn't any problem. You simply have to have function prototypes
|>everywhere and if you have them, you get no warnings or error reports.
|>
|> IF NOT, then IF you have the functions in "bottom up order", all

> I was wondering which is best the Minix, or the MiNT, since I
>am thinking about getting one of then. Which is the most suported by
>people out there.

As usual with software questions, that depends on what you mean by "better". MiNT and minix fill different needs, and which one is best for you depends on what you want:

(1) MiNT is (mostly) TOS compatible, so you can run most ordinary GEM and TOS programs under it. Minix, on the other hand, is (mostly) Unix version 7 compatible; it cannot run GEM or TOS programs, but it also isn't limited by TOS compatibility, so it provides a more Unix-like environment.

(2) Minix is multi-user; users must login and the file system controls access to files. MiNT is single-user, like TOS.

(3) Minix comes with a utility to read TOS format diskettes, but cannot use them directly (i.e. to access a file on a TOS diskette you must copy it using the utility). MiNT (version 0.7 and later) can use both Minix and TOS diskettes, but certain features of Minix file systems (such as file owners and permissions) are ignored.

(4) Versions of Minix exist for the IBM, Macintosh, and Amiga as well as the ST, so the Minix user community is much larger than the MiNT one. However, there are some differences between different versions of Minix (e.g. the 8086 version of Minix limits programs to 128K of memory).

(5) Since MiNT can run TOS programs, in some sense MiNT is "supported" by all the people who write TOS programs. MiNT specific programs tend to be a bit rarer so far, but there are some interesting/useful utilities available (e.g. mgr, a window manager, and several shells including bash and ksh).

(6) Minix comes with a lot of software bundled (including a C compiler). MiNT comes with very little (a bare bones shell) in the package, but most ST users already have a lot of TOS utilities that can run under MiNT, and there are lots of freeware utilities (such as GNU C) available on the network.

(7) MiNT runs on the TT; Minix doesn't (yet).

(8) The source code for both Minix and MiNT is available. The Minix source code is much better written and documented, since it was

designed as a teaching system. On the other hand, the MiNT source code is a lot shorter.

(9) Minix is a commercial product; you must pay for it. MiNT is free.

(10) Minix and MiNT are both somewhat "experimental" and are designed really for people who know what they're doing; neither one is very novice-friendly.

Personally, I would recommend that you try MiNT first, since you won't have to pay for it. There's also a free "demo" version of Minix that you could get to compare the two.

DISCLAIMER: I wrote MiNT because I wasn't really satisfied with Minix, so obviously I'm biased :-).

>I am using Laser C for software development and am considering buying their
>source level debugger. So, a few questions:
> 1. Is it worth $49?

Yup.

> 2. Does it have seperate source and program output windows?

Nope. It uses separate "screens" for program output and debugging
output. You can flip between them at will.

> 3. Is it a true source level debugger (or just a claim)?

Yup. My version gets a bit confused in some if/if/else situations
where I've left out some braces. eg.

```
if( var == var1 ) {
if( var2 ) {
statements
statements
}
else
statement
}
```

The compiler does not get similarly confused. This can be avoided
by including braces all the time.

I have found Laser DB to be invaluable. It has some problems with
programs which crash after allocating memory (and not deallocating
it) I think, but it might have been something else. It is fast and
easy to use.

They have re-written the OS-like routines that the debugger uses,
such as graphics, windows and mouse handling (so as not to interfere
with your program), and is therefore robust.

I OH SO WANTED one of those 1450XLD's. I really did. But they got canned when Tramiel, took over the place.

What a package I thought! But, we got the ST instead...:)..Darn eh?

I would pay for a 1450XLD, just as a collectors item. If anyone has one, let me know how much it would take to part with it.

I have seen adds for mother boards for 1450XLD's, complete, just no chassis to put the guts in. Which is sort of a shame cause in my opinion the machine looked nice.

But I still like my MEGA STE a lot better. :) Did I mention it also runs software a little bit faster too?

But, anyway...save your money and buy a NeXT station. Did you know they got X R4 for it now?

But seriously, hopefully the TT's price will come down to about $1500.00 retail for a 4 meg 80 megabyte/HD configuration. I think that would be a reasonable price for a TT, with its abilities.

What do the rest of you think?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just run across the following back issues of ST-Log in
my plethora of Atari stuff:

Issue 10, January 1987
Issue 11, February 1987
Issue 12, March 1987
Issue 14, May 1987
Issue 15, June 1987

These are all in good condtion and still have covers, etc--which is
not surprising since I never owned an ST (but I was planning on it back
then). I just can't bring myself to throw them out so I'm giving each
issue away for a 9x12 SASE (use an old issue or similar sized magazine
to figure the postage). Just let me know which issue(s) you are
interested in and I'll reserve it for you. If you want the whole lot I
can also work out a special deal.

I had the same problem. My TZ is set to -0500 so that my mail and news
software will generate dates that follow the most recent RFCs'
recommendations against using timezone abbreviations in headers.
Apparently ZOO 2.1 can't understand that format.

A more serious problem, though, is that I can't get ZOO 2.1 to extract
from an older ZOO archive using the x// or -restore commands. I get
bus errors every time. That made it sort of hard to get thelake back
on the air yesterday after a hard drive swap. This is distressing, since
I've always been in the pro-ZOO, anti-LHARC camp.

I think you are wrong.

There are several places that specialize in euro imports (often for very low prices, the euro game market is very fast paced and stuff goes into the bargin bin after a few months). One such place is Sideline Software here in FL. Stealing is stealing, period. If you do it, call yourself a thief, nothing else.

Message-ID: <4e1761w164w@ersys.edmonton.ab.ca>
Source record: 229943

Does anyone know about the new program from DC that is supposed to allow compression of all data on a system while it is active. From what I have heard about the program, it does what it does without slowing the machine down at at all. Is there a demo of this prgram available? I heard that it costs $40, so I don't really want to send money without seeing just how good it is. Even a scaled down demo would be great.

Also, while on the subject, does anyone know if there are any other programs that do the same thing? Or even a program that crunches the files before executing them, and offers only light compression. PFX Pack is a good program, but the compression is too good. Too good?!? Well, the better the compression is, the slower it is to uncompress when you run it. I only want light compression since I don't want to lose the speed of my Hard Drive.

Does anyone have any ideas?

>honest truth is, the PTC1424 is FAR better than the NEC 3D. So, when
>thinking of a colour monitor for the TT, why not consider Atari's own PTC1424?
Hmm. For some reason I thought the number was PTC 1426, but oh well.
Anyway I'm not too happy with the atari mono monitor. Especially when
booting up the big white screen area is a little bit blurred.
Furhtermore after a while the line which is the border between the
screen background and the visible image (e.g. the desktop), is partly
black and partly the color of the image. The place where the transition
occurs moves during time. Atari told me this is normal. However
I'm not too happy about it. It doesn't look right.
Also I noted that the PTC is vulnerable to interference.
It seems that early versions had a metal casing inside the monitor, but
the new ones dont.

I rate the quality of the PTC monitor when used for monochrome less
than the old SM 125 monitor for my ST. Badly enough that one cannot
be used on the TT

Well, PureC's debugger is able to be switched to VDI-mode. This means: If
you want it to, it uses VDI-calls, not it's own GEM-a-like calls.
I like Turbo C, and this was the one and only point I did not appreciate.

Date: 1991-08-05 15:09:54 UTC
From: t821431@minyos.xx.rmit.oz.au
Message-ID: <1991Aug5.150954.27745@minyos.xx.rmit.oz.au>
Source record: 229754

Hello Robert Woodcock!

I was unable to e mail you from minyos (rmit) is bmw@swanne.ee.uwa.oz.au
correct?

Let me know if you find out the program that will allow the st to fax out via
a modem?

email t821431@minyos.xx.rmit.oz.au

1747. Help with UIC transfers to ST!

Newsgroup: comp.sys.atari.st
Date: 1991-08-05 15:20:46 UTC
From: U43610@uicvm.uic.edu
Message-ID: <91217.102046U43610@uicvm.uic.edu>
Source record: 229923

Are there any users who use UCVM (University of Illinois @ Chicago) as the netn
ode to vcarious bases? I can't seem to figure out how to transfer from the UIC
VM to my home unit.. Anyone can help? U43610@uicvm.uic.edu
-
Ken.

1748. zoo 2.1

While exploring my closet I have come across a copy of ATARI ST
INTERNALS from Abacus which is in good condition. I have no use for
it, but I just hate to throw it away. Is anyone interested in it for
$8? (Yes, eight dollars.) I'll pay postage so there isn't any profit
in this for me, I'm just hoping someone can use it.

Yes, my address ends with ".se," but I'm in Texas, not Sweden.

1750. Atari CD-ROM?

Newsgroup: comp.sys.atari.st
Date: 1991-08-05 17:47:52 UTC
From: gjocc@csv.viccol.edu.au
Message-ID: <1991Aug5.124752.6807@csv.viccol.edu.au>
Source record: 229904

Is anything happening these days with the Atari CD ROM?
Last I heard was that certain dealers (in Australia anyway) could
sell you one, but there isn't much software available.

What can you do with an Atari CD ROM?

I know it supports a number of international CD ROM formats, does anyone
have the details?
My specfic interest is getting the CD ROM version of the Oxford Dictionary
for my wife one of these days. (Sure don't have room for a paper copy)

I noticed with interest the release of the CDTV from Commodore.
I have seen magazine articles on computer games in development for the
CDTV, that sound very impressive.
Commodore seem to be pushing this multi-media hype stuff pretty hard,
if it catches on I could be persuaded to by a CDTV for the mega games
that will be available.
(I am not a one-eyed Atari supporter :-))

It seems to me that a STE with CD-ROM and the right software could
perform similar functions.

Atari had a chance to be a front runner in this field but they may have
missed the boat. (Sounds like a familiar story/whinge?)

Sorry for mentioning the dreaded C= :-).

The ST still has quite a few advantages for me (SM124 monitor, MIDI ports
and software). I will be hanging on to it anyway.

And Sometimes I wonder about Un*x and my news software!

To give a digest of what was lost...

Word Up looks for the string "PATH=" in system ram. When I
set up an environment variable in NeoDesk 3.02, Word Up (last version)
found that instead and thought its files were on ".;". To work
around, set the first path for the environment variable to be Word
Up's home directory.
When debugging a NeoDesk problem, do not just disable all auto
programs and desk accessories, but also all the NeoDesk .inf, .not,
and .mac files. You may also have to run NeoDesk from the desktop and
you may have to turn off the fast-load bit on the program under test
(if you have Tos >= 1.4).
BTW, what is the correct way to find a program's directory?
This was discussed on c.s.a.st.tech a while ago, I forgot the outcome.
Word Up now has this bug, a bug that leaves the mouse hidden
if you type control E, has ugly fonts, and is really ***SLOW***.
Only the PC ported dictionary and thesaurus are really good. Hope
Atari fixes it up right and rereleases it before A.D.2000 8-).

```
UZ>Some days ago, I've got lha200 from minnehaha.rhrk.uni-kl.de; its an lharc
UZ>version 2.0, so it can unpack the lh5 method which is even better in
UZ>compression than the 'old' lh1 method. This version is from Th.Quester and
UZ>he seems to be aware of the incompatibility problem, because he built in
UZ>a switch for compatibility with those old unix-lharcs and others, which do
UZ>some wrong things with the headers in the lzh file;

The a-switch is used to create old-style lh1-archives. The wrong things
with headers are recognized automatically. Some time ago I spent a week
or so, to make it compatible to any Lharc-Version I could get. By the way:
The only way to get rid of any incompatiblity is to send me a copy of the
.LZH-File -- and, if available -- the archiver that produced it.

1769. Dialog Boxes

Newsgroup: comp.sys.atari.st
Date: 1991-08-06 01:51:43 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Aug6.015143.20026@lsuc.on.ca>
Source record: 229950

This afternoon I was working on a program and I left it with
a problem that I can't get out of my head, so I thought I'd post
a question about it.

I've been writing a program with a full GEM menu system for
the first time and I've gotten all the calls that I need to open
a VDI workstation and a window. Before I did this I tested the
menu system at the desktop level and the main menu system worked
fine. Dialogue boxes would open and close and disappear, but
anything printed under the dialogue box would disappear when it
closed. Now that I have a new VDI workstation and window openning
up the dialogue boxes don't disappear after they're closed.
So far I haven't seen anything in the manuals that would account
for this (the Lattice C manuals I've been talking about that is).

As far as I can tell there are two possible solutions.
The first is that maybe the GEM system is losing track of the
pointers to the screen RAM or any buffers where the material
under the dialogue boxes might be stored. The only command
possibility I saw that might help was something to do with setting
the "TOP". I think it was "wind_set()". The only other thing
I was thinking was maybe GEM isn't designed to store the material
under the dialogue boxes at all. That would mean that I'd have
to write my own store and retrieve routines. That doesn't make
sense. Is that what all these GEM programs have been doing?

1770. Looking for a good PD D&D Character maintainer with GEM interface...

Newsgroup: comp.sys.atari.st
Date: 1991-08-06 03:04:49 UTC
From: rcte2p@menudo.uh.edu
Message-ID: <1991Aug6.030449.13108@menudo.uh.edu>
Source record: 229947

I am looking for source to a good D&D character/DM maintainance utility.
I once got one called "DM Helper" but it didn't support monochrome and
it was customized too much (need to be able to customize it myself for
use with the 2nd book, etc). I am ready to write one myself if I have
to but I would rather just adapt one that is already out there to my
specific needs...

Thanks.

1774. MINIX/TT

Newsgroup: comp.sys.atari.st
Date: 1991-08-06 07:31:10 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.681463870@cstw18>
Source record: 229814
Cross-posted to: comp.os.minix,comp.sys.atari.st

Hi,

Since mentioning MINIX/TT several people asked about its state and
availability. Well, here are some of the answers on the frequently
answered questions.

1) Does MINIX/TT exist?
Yes, from a certain point of view it is. I have it running on my
system. However it is not yet finished.
2) Have parts of MINIX/TT been posted to the net.
No. I don't consider it "good enough"
3) Is there another way to get a copy?
Mmm. Depends. If you can live with the current version and you have
MINIX/ST we can arrange that I send you some diffs to this version.
As a return favour I'd like to hear from you how you are going with
it. Do not ask for a copy if you do not feel competent to hack the
kernel. Also please give me some motivation what you want to do with
the stuff. Remember that every request I have to deal with costs
some time, which cannot be used for further developments of MINIX/TT
Also please describe your hardware.
4) What is the current state of MINIX/TT
It works. That is, every MINIX/ST program runs on it.
It supports external asci hard disks, and probably one serial
port (I still have to convert from 25 pin cables to 9 pin cables).
I suppose the printer will also work, but I don't have a parallel
printer to test this out.
5) What needs to be done?
Quite a lot:
- support fast ram (there is some code, but it need to be polished)
- support the real time clock
- make use of the mmu and remove the shadowing code
- support the internal hard disk (scsi port)
- support the additional rs232 ports
- clean up stvdu and the font stuff to deal with the TT resolutions.
6) When will this be finished?
No idea. Hopefully somewhere this autumn. remeber this is an
evening job, and that my time is rather limited.

Hope this informs you all a little.

PS: something unrelated: if you read to here, you probably own a TT.
If so, and if you know/have a nice demo which demonstrates the TT
capabilities (e.g. a nice graphic or sound demo), please mail me
a copy. Thanks.

Hello out there,

yesterday my ATARI dealer, received new MEGA STE's. We tested them, but all stayed the same. Again flipping screen and problems in low resolution. :-(
So what to do now?
Sending the machine back to ATARI, will not make it better, cause obviously the new machines have the same mistakes. Atari claims, that there are no problems. A few weeks ago, I posted an article, questioning if anyone has a completely working MEGA STE. Nobody sent a response.
So, my question to you and ATARI,
what can we do with the MEGA STE's?

Bye Christian.

There are two packages for TeX - mtex and musictex - which allow you to typeset
music and lyrics in a TeX environment. You can get TeX for the ST from atari.
archive, and the packages probably from ymir.claremont.edu.

Cheers,

Hi there!

I need some harddisk help:

I want to change my built-in Seagate ST157N-1 and to replace it
with my new Maxtor LXT 213 SY. My machine is an Atari TT030/6
with TOS 3.01, diskdriver AHDI 4.0.

I got only one data sheet with the disk, it says (in german):

Jumpersetting:
...
Jumper 5 (PIN 9,10) activates the Parity (cannot be switched off)
Jumper 4 (PIN 7,8) chooses the spin power option

Questions:
1. I know that the ICD Host Adaptor (often used to connect the
ST 157N-1 with a Mega ST) is not able to drive a SCSI disk without
paritity. This is an information from ICD Germany.

Will the host adaptor in the TT (bought 11/91) be able to drive
my new 210 MB disk?

2. What does Jumper 4 mean???

Thank for your replies, i won't install the new disk before!

BTW: Does somebody know how to connect the ST157N-1 with my Megafile 44?
I want to install it in the same case, are there any built in frames to
hold the disk?

Thanks Bernhard

Guys, I don't think Bob keeps posting this. I would guess a mailer/news
posting problem. So lets not take it out on Bob, OK? Talk to your news
manager and see if you can figure out how to kill it (like sending out
cancelation notices? or maybe something else.)

Look at the message. It has two paths, I think that Bob's message somehow
got slapped on top of, but not completely covering someone elses message.
Also check your message ID's for the various message of subject <None>, they
are all different. So you might want to place something in your kill
files to temporarily wipe these suckers out. Then once they've been expired
from the net, we can remove those from our kill files. What to put in the
kill file, I don't know, any suggestions? Or any other ideas about getting
rid of these messages?

Kurt Olsen
kurto@cc.usu.edu

PS - Bob, I'm not trying to get you "black-listed" (ie. stuck in everyones kill
files), but these do need to be taken care of, somehow.

>up the dialogue boxes don't disappear after they're closed.
>So far I haven't seen anything in the manuals that would account
>for this (the Lattice C manuals I've been talking about that is).
When you have reserved the area under the box using form_dial() and give this area back after closing the box, the GEM will send a redraw message to the former owner of this area. If it was the desktop, the the owner is GEM and it draws the background over all which was there to hide the box.
If there was a window, the owning application has to redraw it for GEM does not save anything exept under dropdown-menues and alert-boxes.

Could it be that they are programmers and not PR types? Yeah, that's the ticket
Lets not lose a great source of (technical) information by alienating A. Pratt
and Ken B. Remember, they don't get paid to answer questions on the net.

Oh dear, chuckie@pro-odyssey seems to have shown up again. This time he drools, amongst rationalizations for wanting to pirate software:

>has anyone else noticed that on the net the atari fellows like mr.Prat and
>company answer technical questions but on why they sit on products and any
>policy they stay quiet.just maybe they don't dare really find out how we
>all feel.

Or maybe it has something to do that Alan Pratt, who does most of the posting from Atari, works in the R&D *technical* side of Atari and has nothing to do with decisions about how longs products are witheld and various other business decisions. What a concept!

> that will be available.

Before you run out and buy a CDTV please wait for CD-I (Compact Disc Interactive). CD-I, the next generation of CD player (developed by Philips, Sony, and Matsushita) will play current audio CDs as well as mega-games and full-motion video (roughly VHS quality). Probably advantages over CDTV are that the nine largest consumer electronics firms in the world will be producing CD-I players, so the software support should be tremendous. Availability is slated for October in Europe, probably a few months later in the US (but I could be wrong either way).

> It seems to me that a STE with CD-ROM and the right software could
> perform similar functions.

CD-I players are based on the 68340 chip, a derivative of the 68020, and CD-RTOS, a specialized version of OS-9. Since the STE (or TT) can both run OS-9, it wouldn't be too much of a stretch for either machine to be CD-I compatible, though it might take some additional hardware (on a VME card?) to support the full motion video.

Considering that they give a hell of a lot better input to
this newsgroup than you have, you shouldn't criticize. However,
the answer to your question could be:

1) Because they are not in charge of releasing products
2) Because they aren't allowed to release policy information
3) Because it's not their job. (See number one).
4) Because they hate YOU.

I suppose it would be silly of me to tell you to get a spell-checker.

Maybe it's because they are technical personnel (i.e programmers) and not in marketing? If the marketing personnel were on Usenet, would you ask them technical questions about hardware and/or software? Chances are, they wouldn't know the answers anymore than Mr. Pratt et al know about Atari's marketing strategies (if they have one :-)).

Now, if Bob Brodie could get Usenet access . . .

There aren't many good books on programming left buyable for
the Atari ST series computers. The only source for printed information
seems to be Atari (the "official" developers docs). It sure would
be nice if some of the more capable programmers would get together
and put out another new set of books.

Source record: 229835

Both UK ST mags (STUser & STFormat) are reporting AtariUK's intentions to make available a CD-I peripheral for the ST/TT (one mag reports the spec). They warn the drooling reader that purchase availability is likely to be early/mid-92 with a guestimated price tag of 400 pounds sterling.

Let's hope that Atari's marketing management make a better job of CD-I than they did with CD-ROM.

1807. Warning: Two versions of Zoo 2.1

Newsgroup: comp.sys.atari.st
Date: 1991-08-07 12:49:50 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Aug7144950@orion.laas.fr>
Source record: 229836
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

There seem to be two versions of zoo 2.1 available for the Atari ST.
Before zoo21bin.zoo came available from the binaries newsgroup, I
recovered from atari.archive the following:

-rw-rw-r-- 1 1401 327325 Jul 14 23:14 zooV21.zoo

This latter version seems to have trouble with the recent postings:
lynxlib2.zoo and sokobin2.zoo.

Any comments?

Why do you want to do this? For security purposes?

The easiest way is to write a program that opens a file and keeps writing some filler character to it (say, 0xe5) until the partition fills up. This will cause every sector on the disk to be used, except for those that are marked in the FAT as "bad" or "in-use" (and except also for a few at the end of the partition that, because of a bug in Gemdos, are never used). Then close the file and delete it. To make this reasonably efficient, you should set up a large buffer in memory, fill it with the filler character, and then write out the whole buffer at once.

I can think of one possible problem with this approach. Sometimes a disk becomes corrupted and contains blocks that are marked "in-use" in the FAT but are not a part of any current files. (This will happen, for example, if a directory entry gets clobbered.) The above procedure would not erase those blocks. You would first need to use a disk analyzer to locate and free them.

If you are dealing with really sensitive data, just writing over it might not be enough. I am told that sometimes the old data can be recovered off of magnetic media by use of special equipment, since writing the new data does not completely obliterate the old. (This is a bit like erasing something written in pencil and then writing something new on top. A faint shadow of the original writing remains.)

Maybe the Double Click people would be interested in producing such a program in the "program-of-the-week" series.

Hey folks,

I'm looking for a way to convert High Res Degas pictures to
Mac Paint format. I know that pic switch 6 will go from Mac Paint to
Degas so I assume the reverse is possible. Anyone have the program to do
it? Either an FTP site or a .UUE file sent through E-mail would be great.

Thanks,

Stephan

I have heard of a program (maybe called DIDOT ART?) that may convert from PostScript or other formats into Calamus Outline .OL or .CVG format. Could someone please send me an address and/or telephone number for where I could get this program?

Thank You!!

Now that Pure C (aka Turbo C 2.0) is no longer being distributed by
Borland, what will it take for the new distributers to convert the
documentation into English? I would imagine that since Borland no longer
has any rights to Turbo C, there should be no contractual problems with
converting the documentation into English.

Gee, don't they like the Atari world? Guess not.

How about an English help guide? Installation, usage, etc. Doesn't have
to be based on the original docs at all. In fact, I'm sure a few
speakers of English/German could get together to market this...

One can always hope.

Thanx for the info.

From: egoldberg@nssdca.gsfc.nasa.gov
Message-ID: <7AUG199113095691@nssdca.gsfc.nasa.gov>
Source record: 229846

Hello, on a local Atari BBS, a certain user has been talking
about the "new" sound in either the STe or TT, and explaining how you
can get infinite voices and about some $1 sound cartridge.

Being an ST owner who flew the coop 4 years ago, none of this
seems logical, although I've heard that the STe has 2 voice stereo
sound in addition to the analog chip.

Can someone here who is familiar with the details explain all
of this to me (i.e. is this person right, full of, uh, commodore
hardware, etc) Thanks!

I know, this has been discussed before. Problem is I didn't think I was interested then and now I find I am.

What I want to know is how can I connect a PC Mouse to an Atari ST. Can someone send me the diagram to do this? Also, the PC Mice that I have the easiest access to are async devices. Can I connect these to an Atari? I seem to remember that you can, but I am not sure. I hope so. Can someone tell me how?

Since this has been around before, please respond via e-mail.

I don't know about the .gem to .img conversion, but if you can't find such a program, there is another (better?) way to do this.

Convert the .gem file to PostScript with mfps. Include the graphic in a TeX document using dvips. Print the resulting postscript file using GhostScript. All of the needed software is on atari.archive.

The nice thing about this method is that the graphic resolution is limited only by the printer (300dpi for a deskjet). Isn't an .img file limited to the ST screen resolution (80dpi)? Also, once you have the image in postscript form, you can scale it, rotate it, twist it, stretch it, etc., without loosing resolution or introducing graininess (is this a word?).

Also, GhostScript can convert .ps files to bitmapped images in .ppm format. I am told that there are utilities for converting from .ppm format to other standard bitmap formats.

1822. TOS (GEM) file selector windows

Newsgroup: comp.sys.atari.st
Date: 1991-08-07 22:32:50 UTC
From: azog@world.std.com
Message-ID: <1991Aug7.223250.25322@world.std.com>
Source record: 229708

Ive got a 2 floppy drive, no hard drive ST system, and TOS 1.0
and want to ask a general question about the file selector window
of TOS...

When a file selector window pops up, at the top is listed the path.
I change the path to the other drive (say B:/) and press the OK
button, but the window closes without giving me a file list. Is
this a bug or a feature of TOS 1.0? If so, is it fixed in later
releases?

I ask because I use a MIDI software package that is copy protected :-(
and in the future I would like to get a hard drive. I can run the
executable off the floppy fine, no problem with me. But I would like
to store my sequences, etc, on the hard drive. But the above solution
would not work. Seems that you can only open a file thru the file
selector window that is on the same drive. Yes no maybe?

Thanx

I have not seen any Atari advertisment during the Tour de France.
Because i'm completely out of intereset for tv sport competition i can have
missed it. By the way it would be surprising if Atari get involved in a team
of any type. They never advertise their products in france, Atari is only
know by the early press informations and by arabian telephone (is it a good
expression in english).

>its _real_ easy to get things done, IMHO

No, i'm sorry you are wrong. Coping a file from a floppy disk to the hard
disk is the same procedure as you would do with the GEM-Desktop. But If You
want to copy a file to an empty disk you can't open a window of that disk,
therefore, you have to drag the file to the disk icon of your floppy disk.
Then you can open a window.

>There seem to be two versions of zoo 2.1 available for the Atari ST.
>Before zoo21bin.zoo came available from the binaries newsgroup, I
>recovered from atari.archive the following:

here we go again. now zoo is going to be ruined like lharc was. i suggest
that all those people who care to dabble with zoo 2.1 (and intend to post
it) get together and organize. there should be one version, not 10.

since there was a quasi-official version posted by our esteemed moderator,
i suggest at least initially, that we limit ourselves to that version
ALONE for posting zoo'd archives of any form (well, 2.01 is ok, too). i
hate to speak for steve, but it would not be a bad idea to either post
here your intentions for working on zoo or drop steve a line and let him
summarize who is doing what. if i had the time, i'd volunteer to coordinate
the zoo effort, but i don't. besides i'd rather work on more interesting
applications (like nroff 2.0 which i just started). i can live with slow/
big archives, as long as i can unpack them :-(

and it would not be a bad idea to contact rahul dhesi as well once we have
a working, optimized version and let him #ifdef atarist into the official
distribution.

if you do work on zoo, do NOT change the algorithm and do NOT change the
file format. optimize the heck out of it and even improve the interface
but do NOT do anything which would render archives unarchivable by the
"standard" release.

The font returned by vqt_attributes (right after v_opnvwk) _is_ the default
font. If MultiDesk changes the default font, FORMAT IT!
There is no need to use Line A variables in this case.
BUT - the default font IS NOT RESPONSIBLE for resources. To fix up resources,
use the AES call graf_handle. The first two parameters return the width and the
height of the char box (in mono 8 and 16). This is the valid height of the
characters in AES dialogs.
The GEM-TOS may work practically (but illegally) with different sizes of the
default font, the AES font and the console font at the same time.

Greetings,
Hayo Schmidt (Hamburg/Germany)

Many thanks to all who replied! I've decided to try to use
the 'vro_cpfm()' blitter call to save and restore the material
under the dialog boxes. So far, it's crashing. I'll be looking
at it again tomorrow. If I can't figure out why it's crashing
I'll post it.

One thing I'm curious about right now: Is there any reason
to open the "physical workstation" if you aren't going to be using
GDOS calls? I haven't found anything in the Lattice C docs telling
me when and where you use 'v_opnwk()' as opposed to 'v_opnvwk()'
except that you can *only* use 'v_opnwk()' if GDOS is present.
But everything I've done (except the 'vro_cpyfm() call) has been
working so far without my using 'v_opnwk()' at all.

>years. Sound like any company we know? Nah.... :-)

Actually, you're somewhat wrong about that. Philips *didn't*
promise it's "imminent introduction for the last three years." Quite
to the contrary, in the early days they specifically said it was
going to take time and if you look back at the announcements and
discussions, CD-I is fairly well "on time." Furthermore, you can
as far as I know get actual CD-I development systems right now.

There are a lot of myths and misunderstandings about CD-I.
Maybe someday I'll say more, but right now I'm burned out. I did
read today that Nintendo is going to back CD-I. Strange world.

1834. PRODIGY and PC-Ditto

Newsgroup: comp.sys.atari.st
Date: 1991-08-08 03:39:59 UTC
From: feather@vuse.vanderbilt.edu
Message-ID: <1991Aug8.033959.3410@vuse.vanderbilt.edu>
Source record: 229707

A friend of mine gave me a PRODIGY starter kit as a wedding gift.
I have an original copy of PC-Ditto and tried to run the Install program.
Everything seemed to go fine during the installation. I have no hard disk
only one 3.5 and one 5.25 external.
The boot disk made by the install program had "data errors" when I
tried to run the PRODIGY file written by Install. This was with the
installation on the 3.5 disk. Several attempts, same results.
Next, I reconfigured PC-Ditto to use the external 5.25 drive as
drive A. For this option, I had to use a 3.5 disk as disk B and format
it to 360K. (PRODIGY knows I have an A and B drive and wants to use both.)
After Install ran, the PRODIGY program executed fine from the
5.25 drive util it tried to get files from drive B, the 3.5. Again "data
error."
The drive has always worked great and has never given a problem while
used either for Atari or IBM. Any suggestions? Is there a later version
of PC-Ditto that can be configured for only one drive, external, 5.25 ?
My version always tries to use the internal drive, either as drive A for a
single drive system, or as A or B for a dual drive system.
I think the software would work if I could only install one drive, the
5.25 . All of the files written to that disk are fine.

Thanks,
Dave

Here in Washington, D.C., I think almost every ST BBS has the "Developer" docs for XCONTROL in a plain ASCII file. I'm a registered developer and I never got the docs, at least not until I logged on to a local BBS.

As an aside, I've also seen an ST emulator for the Amiga floating around. I've seen it work, but the only application that has been tried on it (that I've seen) is DEGAS Elite, and it doesn't save or color cycle. This file isn't very big (about 200+ k uncompressed), and it almost ran the copy protected game "Superman", which is scary. I'm wondering if anyone knows if this is a legal emulator or not, since it has got to have portions of TOS in it...

Let me quote from my Laser C (version 1.01) docs (and probably start a new flame thread):

"The GEM desktop program opens a workstation for the screen using raster coordinates. GEM can only have one workstation open for a particular device at a time, and since the desktop program is always run before user applications, there is no way for an application program to open a workstation on the ST. It can however [sic] open a virtual workstation that inherits the device specific information from the currently open workstation."

Laser C version 1.01 manual, p. 307

> releases?

It's a feature.

Clicking on OK (or hitting RETURN or ENTER) means that you're done.

To change drives on TOS 1.0 file selector, move the cursor to the
path field and change the file mask to reflect the drive you want
in this format:

B:\FOLDER\FILENAME.EXT
Note that you should use backslashes, nor forward slashes.

Then click on the bar at the top of the little window in which the
filenames are displayed. This will prompt TOS to re-read the
directory using the mask you provided. Because of what appears to
be a bug in TOS 1.0, the mask will be wiped out and replaced with
the wildcard *.*, but you'll still get the drive you want.

Click on OK only after you've selected a file.

There are a couple of other solutions you should know about:

-- Third-party file selector replacements, such as Universal Item
Selector and Little Green File Selector. These hook into the system
and replace the standard file selector, providing lots of enhancements
including push-buttons to change drives. UIS III includes quite
a few file-handling functions as well, so you can copy files, etc.,
from the inside of any GEM application.

-- TOS 1.4 provides an enhanced file selector with push-buttons for
changing drives. It's not as slick as UIS III, but it's much better
than the 1.0 file selector. Since you're getting a hard drive, TOS 1.4
is a good idea anyway.

> since sozobon doesn't support such funtions as v_openvwk, graf_handle, and
> appl_exit, is there anywhere I can get a library of gem functions compatible
> with it.

Sure. That's what GEMFAST is for. GEMFAST 1.5 binaries and sources are
at atari.archive.umich.edu. Just include the appropriate libraries on
the command line when you run the compiler, i.e.:

cc -o program.prg program.c aesfast vdifast

GEMFAST 1.6 is included with a new ``Heat and Serve'' self-installing
Sozobon C package from Ian Lepore. I've been testing Ian's package for
a few weeks. It includes some bugfixes in GEMFAST, but the most significant
changes involve the ability to run Sozobon from the GEM Desktop or another
graphical shell. I'm running the new Sozobon C 1.30i directly from Gemini
by double-clicking on makefiles, and it works like a charm.

I'm going to ask Mike Dorman to upload it to a.a., since he's at an
Internet site and I'm stuck with UUCP and a 1200bps modem. (Really!)

Here is a summary of the changes I've noticed from the last official
release:

* A very polished GEM-based installation program creates the appropriate
directories and installs all the programs, header files, documentation,
etc., on your system.

* A GEM environment setter program is included so that global information
can be made available to the compiler components (and other programs, for
that matter) without requiring the use of a command shell.

* CC, the compiler driver program, supports a number of added switches:
-v[1][2][3][4] Numbers now cause cc to pass the -v flag to components.
-r <file> specifies an alternate runtime startup module.
-h holds the screen with a Hit any key... prompt before exit.

* HCC supports ANSI-style concatenation of adjacent string literals, and
there is no limit to the total length of a string assembled by the
concatenations. (ANSI-style concatenation means that if two strings are
separated only by white space, they are logically joined together as if
they were a single string literal.)

* HCC allows C++ comments (// delimits a comment).

* HCC fully supports void* pointers as a generic pointer type that does not generate a type mismatch warning. (This is especially welcome for the ob_spec field of an OBJECT.)

* Include files may be nested to any depth (former limit was 8).

* JAS, the assembler, no longer accepts C-style comments and comments set off by asterisks. (Stars in column 1 still delimit a comment, but semicolons are required to add comments to the end of a line of asm code.)

* JAS processes full ANSI escape sequences within string constants.

* JAS runs 50-100% faster than the original Sozobon version, by Ian's account.

* TOP, the optimizer, is more powerful. Ian has added several dozen new peephole sequences the he says shorten code sequences commonly found in GEM programming, such as access to an element in an array of structures via pointer and index into the array.

* The BUFSIZE environment variable can instruct HCC, TOP and JAS to use large i/o buffers for faster compilation if you have enough memory.

* MAKE is replaced by an enhanced version of a public-domain 'make' utility that is much more powerful. It works with a MAKE.INI file that you can tailor to your environment.

* DLIBS has been modified with several fixed routines, including the XARGS support routines, lmemcpy and bzero functions, and Ian's hand-coded assembler string library functions. (The bugfixes appear to be the same ones that are included in most commonly circulated versions of dlibs. I don't think the argument parser has been upgraded to support the ARGV standard.)

* DSTART.O is supplemented by alternate startup files (apstart.o and minstart.o) for creating GEM applications and desk accessories.

* GEMFAST 1.6 bindings for GEM functions are included.

* Some rarely encountered bugs are documented in detail.

1840. TT and Genlock

Newsgroup: comp.sys.atari.st
Date: 1991-08-08 06:36:36 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.681633396@cstw18>
Source record: 229719

Hi,

What I would like to do, is to record TT images onto my VCR.
I'm not very familiar with this subject, but I'm told I need something
like "genlock" to achieve this.
Now I've read somewhere that the TT should support this one way or
another (by grounding a pin of the monitor plug and supplying a sync
signal on another pin, sorry, forgot which pins exactly).
However, as I see it my TT only delivers RGB signals whereas my VCR
needs CVBS. Is there perhaps an easy way to convert RGB signals to
CVBS? Can I use the CVBS sync as input for the TT?
Or doesn't the VCR provide a sync when recording, but should I supply
a sync signal to both VCR and TT??

Thanks for the info.
Frans.

Source record: 229717

Hi,

Since I now have my TT for a few weeks I was wondering if there aren't any neat demo's floating around for the TT. I looked in the binaries archive and on terminator, but there seemed to be no TT specific stuff, which exploits the TT graphical and computational capabilities. Does anyone have a nice demo for me (or a pointer to where I can find one). Note that I do not have ftp access.

Also I would be interested in a few sound files. I've found quite a number of players in the binaries group, but no sound files to go along with it. Of course I mean sound files for the STe/TT DMA sound subsystem, not .snd files for the TT.

Thanks,

1842. TT problems?

Newsgroup: comp.sys.atari.st
Date: 1991-08-08 06:46:24 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.681633984@cstw18>
Source record: 229718

Hi,

I do have a few things with my TT, of which I want to know if they are
real problems, or if I'm expecting too much from my systems.
The problems are:
1) I see vertical bars, spaced something like every 16 pixels on my
screen. The bars are a little darker line with adjacent a little
lighter line. They are best visible on the desktop when it has a
homogeneous background. It can be seen best by modifying the desktop
color to homegene gray. It seems to be some kind of echo mechanism
since the bars do also appear left of the desktop (in the white
area beside the desktop), but are missing at the very right of the
desktop. Also at the left side of a window or icon the closest two
bars are not visible over the height of the window or icon.
The effect is barely visible with a dithered desktop.
Don't expect this is normal.
Did anyone have similar experiences?
2) When I go to the sound setup menu, and I turn up the bass a little
(with maximum volume). and I press on the figure with the headphone,
the sound I get is pretty distorted. Not only from the internal
speaker but also on my amplifier connected to the TT.
Is this normal and am I pushing the system beyond its limits, or is
this related to the STe problems reported before in this group?
Lowering the volume lets the problem go away.
Also when I click on the headphone figure with the mouse, I can hear a
click on the speaker. For the time being I assume that this is just
a switch-on problem. If you think it isn't, or if your TT doesn't do
so, let me know.
3) The screen (PTC 1426) is a little bit blurred whenever it is all
white (for instance when rebooting). Also there seems to be some
interference with the floppy drive.
I was not used to this, since neither my SM125 nor my sun monitor on
the work does have this.
Furhtermore while the system is on the upper line (that is, the line
between the black area on top, and the desktop) slowly becomes
shorter (so the line is partly black, and partly desktop color, say
green. The first part is black, but this shortens slowly, at the
favor of the green part at the end which gets longer.
According to my dealer this is normal, and part of this is caused
because the PTC 1426 has no internal shielding.
Does anyone have other experiences??

Despite these problems I'm very content with my TT.
It's a great system, and I'm still discovering new capabilities.

I just read in this months ST Luser that Atari UK's marketing manager, Peter Staddon, has just quit. Bearing in mind the massive TV advertising campaign that he *DIDN'T* do and the plethora of double page ST/TT ads in PCW that *NEVER* happened, he will not be missed IMHO.

When will Atari get their finger out?

In the same purile rag, there is mention that Atari are to provide TOS 2.x as 512K ROM upgrade for all machines including STFM's. They do not say who their 'sources' are but it wasn't Atari. I view this piece of reporting as pure nonsense since we know that the Mega STE ROM is 256K and will take TOS 2.x (Lars has done it!) but the STFM has only 192K of ROM address space. Upgrading an STFM would involve some serious hacking to the machine, including a new GLUE chip, and I doubt that Atari are going to do that.

The new Luser hasn't changed much. It's still as gaudy and as game orientated as ever. Maybe it is the best ST mag in the UK but it's still crap.

When will ST User get their finger out?

If you click in the part of the dialog showing the file names, rather than the
`title' bar, then the filename mask isn't wiped by TOS. I think this helps if
there is actually a file of the type you are looking for in the directory you
have chosen.

>It's a feature.

[stuff deleted...]

I also have a question concerning the file selector. I already posted this
question to comp.sys.atari.st.tech two weeks ago but got no response.

I noticed that when giving a relative path to the file selector
of the Atari STe it's impossible to do more "cd .."'s (using the close
box of the window) than the directory where the relative path started.
This has to do with the way the system figures out the parent directory.

An example to illustrate what I mean:

```
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-= sample.c =-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
#include <stdio.h>
#include <string.h>
#include <aes.h>

#define PATHLENGTH (64+1)
#define FILELENGTH (12+1)

main()
{
char path[PATHLENGTH+FILELENGTH];
char file[FILELENGTH];
int button;

(void) sprintf(path, "%s\\%s", ".\\MISC", "*.C");
(void) strcpy(file, "FILE.C");

exit(fsel_input(path, file, &button));
}
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-= sample.c =-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
```

This will result in the file selector showing:

Directory: .\MISC*.C
Selection: FILE.C

When applying the "cd .." button of the file selector it will show:

Directory: .*.C
Selection: ________.___

So, it seems that the system code performs the "cd .." command
by stripping *one* directory from the current path. However,
the used algorithm doesn't make sense in this case.

My question:

Should one only supply full pathnames to the file selector,
or should the described behaviour be considered a bug?

Three notes:

1. The used algorithm (stripping instead of executing "cd ..") does
make sense for file systems which support symbolic links. So, it
is not necessarily a bad algorithm to use. Subject of discussion
is the *way* the system strips.

2. The current working directory of the test application was below
the root of the file system.

3. The above program might perform differently on older TOS systems.

The subject almost says it - should I get TOS 1.4 now (Ihave TOS 1.0)
and use with Neodesk 3, or should I wait for TOS 2.0 to come out, and
buy it instead. I have a 6 ROM Atari STM (1985 model), with 2.5 Mbyte memory
and a 20 Mbyte Supra hard disk.

Please mail to me, and I will summarise to the net.

Thanks in advance,
Andy.Stratton.

No, .IMG files can be ANY resolution, and are great for DTP. I am very interested in a program that can convert between .PS or .EPS and bit-mapped formats (both ways). If anyone knows some ST or Mac software that does this, please let me know. I need one that converts from .PS or .EPS to Calamus .CVG or .OL VERY BADLY, does anyone know about a product that does this!?

It does this on TOS 1.4, too. Sure seems like a bug to me. The only
instance where this is really a problem is when you want to give the
file selector a pathname relative to the current working directory.
Calling fsel_input with ".\\" causes the same problems you describe
since it's a relative pathname. To solve this, I wrote a wrapper for
the file selector that expands an initial . in a pathname to the
complete specification for the current working directory. I.e.,
".\*.c" -> "d:\usr\src\*.c".

The wrapper also puts up a text string prompt. I've included the
C source below. Use it in good health!

Dave Baggett
dmb@wam.umd.edu
------------------------------------------------------------------------------
/*
* Handy File Selector Wrapper
* by Dave Baggett
*
* This routine prompts the user for a filename using the GEM file selector
* and returns a pointer to a complete path specification for the file.
*
* ".\" is expanded to the full pathname of the current working directory
* to work around the GEM file selctor's problems with relative pathnames.
*
* The wrapper puts up a text message in the upper left corner telling the
* user what he/she/it is selecting. The screen is cleared before and after
* file selection.
*
* Remember to write the \'s as \\ in C; e.g., ".\\*.c"
```

```
*
* Example call:
*
* static char path[255] = ".\\*.c", file[14] = "file.c";
* static char filename[255];
*
* filename = file_select(path, file, "SELECT C SOURCE FILE");
* if (filename)
* load_c(filename);
*
* After the call, _filename_ will contain the complete path, e.g.,
* "d:\src\bin\foo.c".
*
* NOTE that the path and file parameters must be static strings (NOT
* literals) because the file_select routine modfies them. This is so that
* the path and file specification will be the same as the user set them
* (with the file selector) in the previous call. A call like
*
* file_select("d:\\foo\\*.c", "myfile", "PICK A FILE");
*
* will NOT work correctly because the path and file parameters are literals.
*
* This source code is in the public domain.
*/
#include <stdio.h>
#include <osbind.h>

static void remove_wildcard();

/*
* Put up a file selector box with prompting text.
*
* A pointer to the selected pathname is returned. If no filename was
* selected (i.e., the user pressed CANCEL), a NULL is returned.
*
* The path and filename strings will be modified.
*/
char *
file_select(path, filename, message)
char *path;
char *filename;

Sorry about this... I just posted a file with my *NEW* signature file stuck at the end. However, I stupidly entered my -Home Phone#- as a consultation number for ST users in the Columbus Ohio area. The number below (left side) is the correct number! Sorry to waste space, but the message was posted world-wide (it was not Columbus specific in content), and I had horrible visions of people calling my house all night with weird and puzzling questions. Note, as long as I have to post this anyway, there is consulting for the ST at the number below, so if you have questions (no questions on games PLEASE), you can call, but not unless you are from the Columbus area since that is the area we service. Again, my appologies (I'll get the hang of this eventually).

>
> Considering that they give a hell of a lot better input to
> this newsgroup than you have, you shouldn't criticize. However,

Our newsfeed's been interrupted recently, so I've only just seen the replies to Chuck Schul's posting. I didn't see Chuck's original posting (things sometimes get lost here when we run out of inodes), and I've forgotten which contribution of mine he was responding to. But just in case any false associations are being made, let me state:

- I very much appreciate the contributions Allan Pratt (and Ken B. and occasional others) makes to the Atari newsgroups.

- I understand why he doesn't comment on product release policy and lots of other things which are outside his responsibility.

We all know that some of Atari's policies are, well, less than wonderful. But the vast majority of us know that this is not the fault of the Atari folk who interact with us on the net. I hope Chuck Schul now knows that too.

Graham

This is a good thing to do, and thanks for the code. I've had problems
with some commercial applications (including PageStream) used across
multiple hard drive partitions because the application didn't pass a
full and proper path mask to the fsel.

Hi!

A few weeks back, Warwick (down under) said he had gotten a patch for PC-DITTO that allowed it to read ST-formatted hard disk partitions. As I don't have access to Genie (I think that is where he said he got it), and all of my mail seems to bounce off his account, could someone send me this patch if you have it? Use whatever arc/lzh/zoo/uud combination makes you happy, as I can access A.A. for any new compressers you may use.

Thanks to any who can help!

-Mike

> fine. Dialogue boxes would open and close and disappear, but
> anything printed under the dialogue box would disappear when it
> closed. Now that I have a new VDI workstation and window openning
> up the dialogue boxes don't disappear after they're closed.
> So far I haven't seen anything in the manuals that would account
> for this (the Lattice C manuals I've been talking about that is).

the proper thing to do for opening dialoges is:
form_center(dialog,&x,&y,&w,&h);
to keep big screen owners happy
form_dial(FDM_START,x,y,w,h,x,y,w,h);
to save the screen area
objc_draw(dialog,0,0,x,y,w,h)
to draw the object
ret = form_do(dialog,0)
to handle the dialog
form_dial(FDM_START,x,y,w,h,x,y,w,h);
to restore screen area

The last call restores only the desktop under the dialog, any windows under it
are updated by the owning application when it reseves the WM_REDRAW message
(Ofcourse your application should listen to incoming message through a
evnt_multi loop). If you did not send your VDI output to a window you don't get
a WM_REDRAW message and should have saved the screen area with
vro_cpyfm function and restore it in the same manner

The Atari CD-ROM drive is (or maybe was) available, at least in
San Francisco. I knew of a store, Computer Rock (shameless plug) that
sold them (although I don't know if they still carry it) and they also carried
a number of CDs to be used with it - some of which were Clip-art CDs which
they put together themselves, which contained literally thousands of
artwork in several formats; the Current Notes PD collection (about two
years worth or something); and a fer others.

As for what the CD-ROM did, as I recall, it could read two standard
formats (correct me if I'm wrong, please), one of which was the High Sierra
Format. I don't remember what the other one was, but I think it's the one
that Macs use.

The CD-ROM could also be hooked up to your amp and could play regular
music CDs. It even has a detatchable remote control, and a desk accesory
that acted as one too.

1860. Compression in 68000 Assembly Language!

Newsgroup: comp.sys.atari.st
Date: 1991-08-08 23:08:33 UTC
From: wo91b@neon-tetra.Eng.Sun.COM
Message-ID: <18220@exodus.Eng.Sun.COM>
Source record: 229737

Netlanders,

The 68000 family is actually pretty magnificent, in terms of what they can potentially do. Some people, though, have told me that the 68000 isn't capable of doing 2:1 formatted textfile/spreadsheet compression fast enough to do it on the fly (ie. 4k/sec on 16MHZ). They say it has something to do with manipulating bits.

Of course, it takes assembly language to do it, but I think it can be done.

I care because I'm trying to come up with compression for some 68k-based communications hardware that a friend is working on.

What I need is a pointer or two to a FAST data (such as spreadsheets or Frame files) compression scheme in 68000 assembly language. I'm willing to pay reasonable amounts for source that has reasonable rules regarding distribution (including patents). (Like LZW is patented, so I can't use it).

If you know of one, and you can send a quick e-mail message to me, please do it, because I'm running short of leads.

Even if all you have is a name!

I'll be glad to forward everything I get to interested parties.

Thanks,

Jim

>as far as I know get actual CD-I development systems right now.

Yes, you can do CD-I development from Suns, Macintoshs, CD-I players (early
models have been available for several years now to developers), or any
system running OS-9 (including your ST). My latest information is that
CD-I will be introduced in selected US markets and retailers this October.

> There are a lot of myths and misunderstandings about CD-I.
>Maybe someday I'll say more, but right now I'm burned out. I did
>read today that Nintendo is going to back CD-I. Strange world.

Yes, Philips will be providing Super Famicom (16-bit Nintendo) games on
CD-I disc for use with your CD-I player. I think, in time, that CD-I will
be a smash. Keep in mind, both CD Audio and VCR's took three-or-so years
to take off.

Disclaimer: My company produces the operating system CD-I is based upon as
well as CD-I titles and development tools.

Hi,

there is something like that, but since now it's only available in
Germany. The guy, who wrote that stuff, has developed many of these
utilities to convert anything to anything. Here is his address:

API-Soft
Andreas Pirner
Bundesallee 56
1000 Berlin 31
Germany

All of his utils cost about DM 50.- to DM 100.- (1 US$ is DM 1.85)

1866. Ethernet box/cartridge and software for 1040ST?

Newsgroup: comp.sys.atari.st
Date: 1991-08-09 04:47:48 UTC
From: georgen@gpu.utcs.utoronto.ca
Message-ID: <1991Aug9.044748.13420@gpu.utcs.utoronto.ca>
Source record: 229742

Got an old 1040 lying around that I'd like to link up with my NeXT and PC.
Are there any Ethernet hardware/software for the ST? Perhaps something
like those Xircom thingies on the PC...
Please email me since I don't read this newsgroup much...thanx

I would think twice before doing this. Unless French law is drastically
different from American law, the code in the ROM chips is protected by
copyright law.

It's archived with ARC 6.02, which handles subdirectories.

Hi there,

wat did happen to DC Software ???

I didn't find something new since several weeks, not on

- atari.archive.umich.edu (dir utilities/doublick is even empty! 9.8.91)

- comp.binaries.atari.st

I really like these little tools, after all they run on a TT, and I miss
the news each week.

I hope I'll meet you guys from DC on Atari fair in Duesseldorf as announced.

Bernhard

I tried zooV21.zoo from atari.archive and it didn't work!
The version from comp.binaries.atari.st is much better. This version is
available at our archive by anonymous FTP or by our Mail-Server.

*****> by anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your email address (you@your_domain)
Usage: see the ftp(1) manual on your system
File: ATARI-ST/utils/zoo.zoo
ATARI-ST/archivers/zoo.ttp
Important: don't forget to set binary mode.

*****> by our Mail-Server program:

1) The Mail-Server can be reached at the address

mail-server@cs.ruu.nl

2) The Mail-Server understands a couple of commands, all commands
must be in the message body. The first thing you might want to
do is ask it for help:

send HELP

3) The Mail-Server will send you the UUENCODED package
if you put the following commands in the message body:

begin
send ATARI-ST/utils/zoo.zoo
send ATARI-ST/archivers/zoo.ttp
end

Note: The zoo.ttp is the binary file in case you don't have an older version
of ZOO to extract zoo.zoo.

I believe you can do that via ViewGIF 1.2, which should be available
at atari.archive.umich.edu (VIEWGIF12.ARC or something similar)...

Hope this helps...

Robert Anisko
rjast1@unix.cis.pitt.edu

it also converts to/from some other formats (can't tell ya at the
moment as my ST is on temporary hiatus)...

Nothing personal, dude, but what you are doing is advocating piracy in the most blunt terms. If you want TOS 1.4, BUY IT - if you could afford a computer, surely you can afford this moderate upgrade. Copying TOS (and possibly dumping TOS for that matter) is kinda ILLEGAL, ya know? I'm sure Atari, who OWNS TOS would not be too thrilled with this suggestion of yours, and since you posted your name/address in that message, they know right where to send a very FRIENDLY warning.

So have some class and make it simple - shell out the $89 or so (whatever it is in francs) and BUY IT. It's relatively painless, and doesn't screw over Atari and the limited following it has, ok?

Source record: 229610

```
MF>files before executing them, and offers only light compression. PFX Pack
MF>is a good program, but the compression is too good. Too good?!? Well,
MF>the better the compression is, the slower it is to uncompress when you
MF>run it. I only want light compression since I don't want to lose the
MF>speed of my Hard Drive.

You are not right at this point: PFXPAK only has a difficult
compression-routine. The decompression is verry simple. It reaches
a rate of 100KB per second on a normal machine (900 KB on a TT).

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested
in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the
percentage of votes for each ranking. The following character codes can
appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT"
in the newsgroup rec.games.video for more details, including information
on how to vote.

Questions, comments, problems, and errors should be directed to the list
maintainer at either of the below addresses:

Wouldn't this be an idea for a dc week utility. A TSR that parses all pathnames
before calling the system routine. So these commercial applications will not
cause problems to anyone. But the TSR should really be tiny. Else we could use
a extended file selector as well. Or is it a challenge for Lars-Erik Osterud to
write the smallest path parser in the st world. The best way for sure would be,
that the people at atari would change the fileselector to do this stuff.
Or does TOS 3.xx already expand paths in the fileselector?

1877. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-08-09 10:05:22 UTC
From: erc@radon.berkeley.edu
Message-ID: <42877@ucbvax.BERKELEY.EDU>
Source record: 229752
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

To use this ballot, just hit "R". Once in your editor, insert your game rating between the word "vote" and the system code and game title. Your rating must be an integer between 1 and 10. There must be at least one blank on either side of your rating. Make sure the word vote appears at the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor. The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in a format similar to the existing entries. Be sure to include the system code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GG = Sega Game Gear
GS = Apple II GS MA = Apple Macintosh
NE = Nintendo NES and Famicom NG = SNK NeoGeo
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress, and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This text was adapted from Chuck Musciano's rec.arts.movies ballots and John Leo's rec.games.video ballots.)

Try looking in ~atari/dc. There was simply too much stuff there to
keep it in utilities. It definately warranted it's own directory.

Well I do know of one called Bridge Player 2150, but is not PD
and comes from the UK.
If you e-mail me I can send you some more info on it, that I don't
have handy at the moment.

Well I think that you will find that TOS 1.4 is all you will be able
to get..
TOS 2.0 would be on bigger Roms, 256k not the 192k that is in your system..

I checked this out yesterday (as a matter of fact) just to make sure they got everything we sent. I found the usual directory empty and was wondering, then I noticed that Jeff was kind enuf to give us our own directory in atari/dc

Seems we're moving up in the world (in the file hierarchy that is :-).

(1) It's always a good idea to get Rainbow TOS.
(2) As far as I know, there won't be a TOS 2.x for old (192 K ROM)
machines.
(3) Take a (free) llok at Gemini 1.21, too. It's shareware and lots of
people prefer it over other desktops.

Date: 1991-08-09 18:52:33 UTC
From: apratt@atari.UUCP
Message-ID: <3013@atari.UUCP>
Source record: 229775

jansteen@cwi.nl (Jan van der Steen) writes:
>I noticed that when giving a relative path to the file selector
>of the Atari STe it's impossible to do more "cd .."'s (using the close
>box of the window) than the directory where the relative path started.
>This has to do with the way the system figures out the parent directory.

It has to do with what the file selector does when you hit the close box. It parses the path string and cuts off one level of subdirectory. This is strictly string manipulation, having nothing to do with low-level filesystem notions like parent directory. I believe the file selector must be given a string which starts with a drive letter and a backslash (i.e. a full path), or the close box will eventually get you to an invalid path and goodness knows what will happen.

>write the smallest path parser in the st world. The best way for
>sure would be, that the people at atari would change the fileselector
>to do this stuff. Or does TOS 3.xx already expand paths in the fileselector?

Actually, the best way for sure would be for the people who wrote these
commercial applications not to ship buggy code. The file selector does not
properly parse relative paths (as has been pointed out here) and as such
passing a relative path to the file selector is Not A Good Thing To Do.
Writing a TSR to fix buggy programs might not be a bad idea, but not
shipping buggy programs (or "programs which trigger user-interface oddities
in the operating system" if you prefer) is a better one.

>therefore, you have to drag the file to the disk icon of your floppy disk.
>Then you can open a window.
>
>Martin

(the above is opinions about Microsoft Windows 3.0 vs. GEM)

But Windows doesnt have drive icons, the same as GEM.

GEM: to copy from floppy to HD:

Click on the hard drive icon, and open it up to the path. The open the
floppy, and drag the icon from floppy to hard drive.

Windows:

Open the file manager. After it scans the whole hard drive, open drive
a. Choose COPY under the menu FILE menu bar, and TYPE in the path

Which is easier?

1888. How to bind gulam keys in ue

Newsgroup: comp.sys.atari.st
Date: 1991-08-09 19:37:59 UTC
From: zafiris@motcid.UUCP
Message-ID: <7622@navy16.UUCP>
Source record: 229768

I have beta-test version 1.03.04.05 121887 of the gulam shell and want
to redefine the key mappings for the emacs editor. I tried kb -r xxx yy
but that does not seem to work and sometimes even messes up the rest of
the keys so, for example, keys a, b, and c become NOPs and don't work any
more. Is there anything special that has to be done? The command:
uekb xxx yy worked just fine for the alpha-test version I used before.

What am I doing wrong? Thanks for any clues... ...John

1889. archive-server: HELP !

Newsgroup: comp.sys.atari.st
Date: 1991-08-09 20:25:34 UTC
From: snoret@unx.sas.com
Message-ID: <1991Aug09.202534.17201@unx.sas.com>
Source record: 229765

I am rather a novice to the net, so I figure I'd ask
a (hopefully) simple question and save myself hours
of frustration and heartache. Here we go:

All I'm trying to do is get some of the binaries
from the archive-server@twitterpater.eng.sun.com.
I mailed a request on Monday, and still have not
received the uuencoded reply. Now, before you all
tell me just to be patient... yesterday I decided
to request the help file and the index. I
received them both the same day I requested them!

My question is this... does the server naturally
send help and index requests BEFORE files, or is
there something wrong with my syntax. I thought
I was doing it just the way the help file said:

send binaries/volume1 arc

Notice I remembered to replace the last "/" with
a space. Please tell me I not crazy (well, ok...
maybe just a little :)

I believe the soon-to-be-released (Dave?) 68030 upgrade from Gadgets by
Small will let you crank it up to 12megs RAM, I believe.

As for networking, you might check out some information on "Universal
Network", a kinda offshoot of the Universal Item selector. I dunno if
it works in conjunction with other systems on a net, but its worth
look into,anyways...

| or should the described behaviour be considered a bug?

I think this is a case of "Doc, it hurts when I do this..." As Allan has said, if the file selector misbehaves when you pass it a relative filename, don't pass relative filenames to the file selector. It bothers me when I see programs doing this, because what does "." mean when a program brings up a file selector? For all I know, the program could change directories numerous times for its own devious purposes. How the heck do I know what its idea of the current directory is?

Please use fully qualified pathnames in the file selector. I know that means you can't go very deep, but that's life on one line of a 40 column screen.

hofer@urz.unibas.ch (Remo Hofer) writes:

|Wouldn't this be an idea for a dc week utility. A TSR that parses all pathnames
|before calling the system routine. So these commercial applications will not
|cause problems to anyone.

I'd like to echo Allan's sentiments on this one, too... fixing "bugs" for no other reason than to allow buggy programs to run is A Bad Idea.

Believe it or not, I may even be more rabid about this issue than Allan. I think Atari should do everything in its power to discourage lazy programming. Our goal should be able to point at programs available on our computers and show how easy they are to use, and how robust they are. We shouldn't be required to apologize for the number of auto folder programs that you need to patch various bugs/features/whatevers so that programs X.PRG, Y.APP and Z.PRG can all coexist peacefully.

I think people who write little TSR helper programs shouldn't waste their time writing auto folder patches that let DB Master One run under TOS 6.7. They should spend their time enhancing the utility of TOS machines, so we move forward.

1897. Multi V1.0 - Midi Sequencer

Newsgroup: comp.sys.atari.st
Date: 1991-08-10 04:21:07 UTC
From: umhagma1@ccu.umanitoba.ca
Message-ID: <1991Aug10.042107.13553@ccu.umanitoba.ca>
Source record: 229777

Has anyone looked at this fine piece of software yet? It apparently came out just about a half a year ago (I think). How do you think it rates to other packages? Alchimie *was* a nice sequencer (mainly because shareware). But when you want REAL support, I guess you got to pay a few more bucks (I figure).

It's retail price up here (BRRRRRR...<-what a joke) Winnipeg, Manitoba (Canada for those of you who don't know), is around a whopping $495.00 (CAN).
Anyone else have any prices?

Thanks for any info. (or any corrections)

>are available via ftp in europe under anonymous account by the
>University of Koeln/Germany. The numeric ftp-adress is
[stuff deleted..]

hello robert,

we have just test your new version 3.0 of The Vault.

THERE is still the same bug as in your old versions :

Try to use a deep path, like more than 50 Characters in the GEM-Input-Line,
The Vault will crash, overwriting his own memory, asks for disc-changes
and then bombs... ugghh 8-(

An other little bug is this one :

If there is a file with a name " . " (you see, a blank name),
than The Vault don't abort with an errormessage, but try go on with
backuping. BUT don't really backups the files !

Hope that helps !

PS: I've heard, you sold your ATARI ST. Is that true ?
Who will support your really good program ?(sources avaible ?)

cu Jochen (not the FRITZ, but a FRANZ !)

Hope, my bad english will be understood...

Source record: 229782

In article <1991Aug7.205102.27984@news.cs.indiana.edu> pwp@iuvax.cs.indiana.edu (Paul Purdom) writes:
>Can someone send me an address for HiSoft in England (or a US address if
>they have one)? Does anyone know of a better place to obtain the latest
>version of Personal Pascal?

I didn't even know until you mentioned it that they had Personal Pascal
on their list! And I've been wondering where to find it.

However, a full-page advert in the July issue of ST Applications informs that:

'HighSpeed Pascal - comes from Denmark - extremely fast and friendly -
closely compatible to ... Turbo Pascal, even including the graphics unit
from the PC - compilation speed ~20,000 line/min with excellent
code generation for the St and TT.

Price: UK pounds 89.95.
Existing Personal Pascal users can upgrade at a reduced price.'

Today's tourist rate is about $1.66/pound => ~$150.

HiSoft is at: The Old School
Greenfield
BEDFORD
MK45 5DE
U.K.

Any help?

1903. Minix question..

Newsgroup: comp.sys.atari.st
Date: 1991-08-10 11:03:31 UTC
From: yonder@netcom.COM
Message-ID: <1991Aug10.110331.7403@netcom.COM>
Source record: 229778

I've been strongly considering getting Minix (I sure wish it was a little cheaper -- does anybody know of a souce besides direct to Prentice Hall?)

My question is: Which version is better, the MAC or ST version? The reason I ask is becuase I have a Spectre so I could run the MAC version. If they are pretty much the same, it would seem ST would be superior because I wouldn't have to run it under emulation. Also, I have read that the Amiga and ST binaries are compatible (under Minix) does anyone know if this is true for MAC as well?

Well, any help in the area would be great.. Thanx...

P.S. I don't suppose somebody has a copy of Minix they would like to sell, c'mon now, there's gotta be somebody out there who has it sitting around collecting dust....

> application program to open a workstation on the ST. It can
> however [sic] open a virtual workstation that inherits the
> device specific information from the currently open workstation."
>
> Laser C version 1.01 manual, p. 307

So that would mean that "v_opnwk()" in Lattice C is an entirely
bogus command! Neato! :-)

Conclusion #1: We need some new books put out on GEM/TOS programming.
Hopefully, some of those books will be the manuals that come with
these compilers.

Conclusion #2: (Ahem. I have another conclusion but I think I will
not currently state it in public. :-)

Supposition: "v_opnwk()" is probably necessary for some GDOS commands.
Probably I'll find this out if I ever actually use a GDOS related command.
That's fair enough. In the mean time, I won't worry about it and I
won't use it.

1907. Uploading to atari.archive and comp.{b,s}.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-08-10 18:42:10 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Aug10.184210.6077@terminator.cc.umich.edu>
Source record: 229616

Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

```
cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."
```

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=60 K or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to atari-binaries@twitterpatter.eng.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!twitterpatter.eng!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@twitterpatter.eng.sun.com. If you are on a UUCP-only site, you can send them to sun!twitterpatter.eng!atari-sources.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'

"uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

1908. Ftp beginner's guide

Newsgroup: comp.sys.atari.st
Date: 1991-08-10 18:44:06 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Aug10.184406.6171@terminator.cc.umich.edu>
Source record: 229614

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.
~~~~~~

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

1909. The University of Michigan Archives

Newsgroup: comp.sys.atari.st
Date: 1991-08-10 18:48:21 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Aug10.184821.6294@terminator.cc.umich.edu>
Source record: 229613

[Thought this might be of general interest to you folks that have
more than one machine. Lemme know if you'd like more info......
-weiner]

Welcome to the University of Michigan Software Archives.

We are at archive.umich.edu [141.211.164.153] (aliases mac.archive.umich.edu,
msdos.archive.umich.edu, and apple2.archive.umich.edu) and
atari.archive.umich.edu [141.211.164.8] Please use symbolic addresses
if you can since the archives move occasionally.

--- what's here ---
There are a number of collections of public domain, freeware, and shareware.
More are being planned. Here are the directories you will see.

at archive.umich.edu
mac Macintosh software
msdos IBM PC and compatible software
apple2 Apple 2 software
next.ftp NeXT software
linguistics linguistics software (just beginning)
physics physics software (just beginning)
mac.bin not for ftp access (local Appletalk service only)
next not for ftp access (afs only)

at atari.archive.umich.edu
atari Atari software

--- ftp access ---
You can use ftp to get to these archives (anonymous login, any password).
There are currently no restrictions, but for load management reasons limits
may be imposed in the future. Please show consideration to the regular users
of atari.archive.umich.edu and restrict anonymous ftp access to evening
through early morning EDT (-4:00 GMT). Users of archive.umich.edu need not
make such a restriction, but will get better response in the that time period.

--- afs access ---
If you are using AFS (Andrew File System) you can get to the archive
directory (excluding the atari archive) with
cd /afs/umich.edu/group/itd/archive

--- email access ---
You may request that files be mailed to you from the atari archives (see
the Help file in those archives for details). This service will be expanded
to include other archives in the future.

--- work in progress ---
We are planning additional archives, additional access methods, more
documentation, mailing lists, and better indexing. Suggestions are welcome.

--- contacting humans ---
Most of the work on the archives is being done by volunteers. And while their
time is necessarily limited so a response may be delayed, please contact them
with questions, suggestions, submissions, or praise. They can be reached at
apple2-archivists@archive.umich.edu
atari-archivists@archive.umich.edu
linguistics-archivists@archive.umich.edu
mac-archivists@archive.umich.edu
msdos-archivists@archive.umich.edu
next-archivists@archive.umich.edu
physics-archivists@archive.umich.edu

so far as I know, the ".img" files are not bound to any resolution, they are just plain bitmapfiles which also can be with colorinformation.

From: ford@tharr.UUCP
Message-ID: <2510@tharr.UUCP>
Source record: 229793

My first PTC1426 was way out of adjustment, firstly it was completely out of
focus, secondly as you turned down the brightness the white turned to purple!

As you may have guessed, I got it replaced.

The new one is much much better (maybe Atari had installed some sort of
quality control by the time this one was made, or was it just luck that
the components were in the right positions? :-)).

The quality of the display is up to that, if not better than, most multisyncs
I've seen, though I wouldn't call the Atari monitor a multisync as it can't
handle either 50Hz or 70Hz sync, just 60Hz! (There is a switch on the back
for switching between TT and IBM-PC VGA modes, but all that does is alter the
width of the picture)

My conclusion, the PTC1426 is a good monitor for the TT (even in Mono, Frank)
as long as you don't mind paying way over the odds so that the monitor fits
nicely on the TT, and you get one which has actually been adjusted!

1914. Help for an old, handicapped ST?

Newsgroup: comp.sys.atari.st
Date: 1991-08-11 01:54:15 UTC
From: bane@tove.cs.umd.edu
Message-ID: <37911@mimsy.umd.edu>
Source record: 229795

My ancient and revered 520 has a problem. Its serial port has partially
died; it can send but not receive characters. To give you an idea of
how old this machine is, it started out with a single-sided external floppy.
It now has an external double-sided floppy, an 80 meg hard drive, and a
1/2.5/4 meg RAM board from Tech Specialties (currently at 2.5 meg).
The serial port is important to me, as it's how I do my backups.

I'm trying to find the cheapest way of fixing this mess. The options I've
thought of are:

Get the old machine fixed (but where? and how much? and how long?).

Buy another used ST; I'd only do this if I could transfer my RAM board
to it. Anybody got an old but working machine they want to unload?

Buy a new ST. As I really need the big RAM for desktop publishing, I'd
probably go for a Mega 2.

Give in and buy a more mainstream machine (but what about my old files? and
besides the new Apple/IBM alliance makes my skin crawl...).

Anybody else ever have a serial port hardware problem? Did you solve it?
Anyone have a machine to sell?

Please respond via mail, as I'm 200 messages behind in this newsgroup.

1919. GCC question

Newsgroup: comp.sys.atari.st
Date: 1991-08-11 06:54:59 UTC
From: michael@dime.cs.umass.edu
Message-ID: <34657@dime.cs.umass.edu>
Source record: 229797
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This is probably a silly question, but I've installed GCC on my system and can't get it to compile anything, so I'll ask anyway.

The problem is how it is treating TOS filenames. If I try to compile using a command such as

gcc -O -c test.c

then it will not see the file. If, on the other hand, I try to compile with

gcc -O -c TEST.C

then it DOES see the file, but it doesn't seem to know what to do with the .C extender, so no actual compilation takes place.

Is there a switch or an environment variable I can use to correct this?

Thanks in advance,

Michael Kieras

1920. Using a big hard disk

Newsgroup: comp.sys.atari.st
Date: 1991-08-11 07:01:59 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Aug11.070159.11845@chinet.chi.il.us>
Source record: 229798

I got an impossibly great deal on a ST-4702N (600 MB Wren-V). I have it hooked up to my BMS-200, and it responds to commands alright. I can even get the BMS disk initializer to prepare 60 MB of useful file space on it. But I want to set this thing up as a large number of large partitions, and to do that I need HDX. So far, with a few reasonable tries, HDX refuses to do ANYTHING with this disk. Any suggestions?
Steve saj@chinet.chi.il.us

1921. Puting a pixel to screen

Newsgroup: comp.sys.atari.st
Date: 1991-08-11 07:03:00 UTC
From: lahtinen@gideon.gideon.fmi.fi
Message-ID: <LAHTINEN.91Aug11090300@gideon.gideon.fmi.fi>
Source record: 229621

I want to know what is now the "official" way to put a pixel to screen.
I have read form this group that Line-A is not a good idea, but I did
not find any simple pixel routines from VDI.

I hope it is not too slow.

Well there is this PC thing that is also available for the Atari that
uses the Cartridge Port, I think that the PC one uses the Printer Port,
gives about 10 megabytes transfer rate and the same on the Atari.

It is called Lantech ??, is this the correct name..

But please correct me on this as I have only heared about this 3rd hand

Source record: 229635

Thank you for your reply, but I am afraid that it is no use for me, as
I have a high resolution graphics card. And if I am correct you routine
writes directly to screen memory, but you can not write to screen memory
of the graphics card.

Actualy you could but you have to use different system with every different
graphics card.

So I am looking for a general solution using normal system routines.

I always thought we needed GDOS installed to make an effective call to
v_opnwk(). I've never programmed GDOS, but most of the books that claim
v_opnwk() to be useless were written before the advent of GDOS itself. I
don't know about whether it allows more than one workstation open per device,
but I'm sure Allan Pratt or K. Bad could point everyone in the right direction

Speaking of Mr. Small, does anyone know when he is going release an upgrade for 3.0 that cures the numerous problems with the MEGA STE??

And of course, will his upgrade board be compatible with Atari's new MEGA STE?

????????? Abybody know what Mr. Small is doing about these things?

I would like to know before the November show as to decide whether or not I want to attend (Chicago).

HDX? You MUST be joking. I ASSUME you modified the HDX settings file,
that lists all the characteristics of the HD. You must use that option
because the standard GEM program doesn't list that kind of drive available for
formatting.

Gosh, you didn't say exactly what controller or host adapter your using.

For a drive like that, I would consider ICD's utilities, and hardware to
make it scream.

Could you be more specific? Maybe repost?

for use at the Atari Messe in Duesseldorf.

We will need to borrow the machine for the entire show. We will provide any
helpful individual with a free pass for all days of the show, plus a copy
of our software packages.

We can arrange to pick the ST up if it fits in our travel plans. We will be
in Frankfurt, Munich, Wiesbaden and Duesseldorf before the opening of the show,
but we could travel by train to get the equipment.

Please reply in EMAIL to:

uace0@menudo.uh.edu <-- (that's a zero - uace0)

If you can help us out. We would **greatly** appreciate any help.

Thank you. And now back to the news.

- mike

>Gosh, you didn't say exactly what controller or host adapter your using.

Yes, he did mention the host adapter - a Berkeley Microsystems
BMS-200. I would recommend calling Berkeley Microsystems. I had a
similar problem when I first got my HD/BMS-200 combination and they
were very helpful. Unfortunately, I don't have the number. You
should be able to get it by calling directory assistance and asking
for Berkeley Microsystems of Oakland (California).

Just replace the RS232 receve IC. MC1489A/UA1489A, this is IC No. U13
in the old ST's.

They can some times get damaged with Modems that don't have a earth,
and you plug them in with the power on..!!

I know I used to work for a Big banking net work, the bigest in NZ.
and we used to replace at one time some 2 IC's a week..

Well HDX is now upto Version 4.01, but that is for the 'TT',
the old one should be Version 3.02..

You will need to write the settings for that drive into the Wincap
file, get a text reader "Tempas" and have a look at the Wincap file,
from the info in the Wincap file and the info you have on your drive
you should be possible to create your own entry to the Wincap file,
for that drive.

>were very helpful.

I actually called Berkeley Microsystems before buying the disk, and they gave me a few suggestions. I can now use all 600 MB of it using their "if all else fails" method (partition using their fourpart partitioner). The version of Atari's HDX I'm using is recent enough that it asks whether the drive is on the SCSI or the ACSI bus. I've tried all sorts of plausible WINCAP entries, and HDX absolutely always says it can't partition the disk until it's formatted correctly, and it can't format the disk.

I guess, since AHDI drives the disk ok, what I really need now is a way to define the last partition on the disk as an 'XGM' partition, and to parcel it out. Something that leaves the first 3 partitions alone wouldn't hurt, but isn't necessary either.
Steve

1938. Accelerators for the ST forsale

Newsgroup: comp.sys.atari.st
Date: 1991-08-12 05:04:38 UTC
From: stevef@bug.UUCP
Message-ID: <757@bug.UUCP>
Source record: 229651
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included. I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request. Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

If you want one of these, call or send a check to:

1939. Re: TT and Genlock

Newsgroup: comp.sys.atari.st
Date: 1991-08-12 07:05:22 UTC
From: lahtinen@gideon.gideon.fmi.fi
Message-ID: <LAHTINEN.91Aug12090522@gideon.gideon.fmi.fi>
Source record: 229665

I noticed you request for a Genlock (or similar) for Atari, here is one clue:

ELV
Postfach 1000
D-2950 Leer
Germany

fax: +49-491-72030

They are making kits for all kinds of stuff but they have also ready made
things. The products you might be interested are:

9197 Genlock for Atari ST DM 298,00 (kit)
9198 """""""""""""""""""" 398,00 (ready made)

9199 ST fix (you need this) 9,95 (kit)
9158 "" 19,95 (ready)

3707 VCP 7001 (RGB->video) 199,95 (kit) PAL
3710 "" 498,00 (ready) PAL

8108 Audio-Video-Prozessor 695,00 (kit) PAL+NTSC+Secam
8109 "" 1198,00 (ready) ""

And then you need little soldering skills (at least to put that
little fix to your computer) and some ability to read German.

That AVP 300 is a superior thing, you could convert between different
color systems and mix sound and correct color balance. You could
use it without a genlock to record only the computer signal to VCR.
With genlock you can combine video and computer graphics.

There is also an English company selling genlock for Atari
(I think they are PAL):

Third Coast Technologies
Unit 8,
Bradley Hall Trading Estate,
Standish, Wigan
Lancashire, WN6 0XQ
U.K.

From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <14336@uhccux.uhcc.Hawaii.Edu>
Source record: 229623

In article <1896@mwca.UUCP> bill@mwca.UUCP (Bill Sheppard) writes:
>CD-I players are based on the 68340 chip, a derivative of the 68020, and
>CD-RTOS, a specialized version of OS-9. Since the STE (or TT) can both
>run OS-9, it wouldn't be too much of a stretch for either machine to be
>CD-I compatible, though it might take some additional hardware (on a VME
>card?) to support the full motion video.

I hope more information can be given on CD-RTOS. A Magnavox brochure
describes it as providing a user shell with the following functions:

o Auto-start CD-I
o System entry
o Load Application
o Display Time/Date
o CD-DA auto-start/repeat/shuffle
o Info (calls up function info screen)
o Dim screen

Mating Microware's CD-RTOS with Motorola's M68340 super-muscular micro-
controller sounds awesomely devastating. Supposedly, one series of CD-I
machines will use a Signetics 68070 which is something like a 68K with
integrated DMA, timer and I/O support. I don't know much about the M68340,
but found this info about a close relation, the M68332:

"The 68332 is the first member of Motorola's revolutionary new
family of highly integrated, high-performance 32-bit devices
designed to meet the ever-increasing demands of embedded-control
functions.

The 68332 is the world's most powerful microcontroller with a
high-performance 32-bit CPU core. The CPU is surrounded by
'smart' peripherals, including a powerful RISC-like TPU (Time
Processor Unit), to reduce CPU overhead. The result is the
ultimate in system performance.

Just as the human brain has two hemispheres, one for sequential
logical operations and one for simultaneous creative operations,
the 332's CPU and TPU perform as two powerful CPUs on one chip:
one to process numbers and one to process time. For many appli-
cations, our two-CPU approach is more powerful than any feasible
single-CPU alternative.

The 68332 is truly the best of both the microcontroller and micro-
processor worlds. Its high degree of system integration eases
system design and slashes the total chip count.

Functional modules of the 68332 include:

o A 32-bit CPU fully compatible with the 68K Family
software.

o A RISC-like high performance TPU which processes 16
channels of time-based event functions independent
of CPU intervention.

o The TPU has a prioritized scheduler, RAM and ROM
to help manage sophisticated time-related control
functions.

o A Queued Serial Module containing two separate serial
interfaces, one synchronous (SPI) and one asynchronous
(SCI), for easy attachment of specialized, off-chip
peripherals without using the CPU as an interface.

o 2KB of fast static RAM with standby capability for
low-power applications and battery backed-up operation.

o A System Integration Module (SIM) containing programmable
chip selects, system clock, periodic interrupt, test/emul-
ation, and system protection features.

Additional members of the 300 Family will be introduced that will
provide a variety of peripherals and discrete logic functions com-
bined with a powerful 32-bit CPU. Available modules will include
ROM, DMA, A/D, EEPROM and many others."

The M68340 would probably have the integrated DMA and maybe the ROM and
EEPROM. Its clock speed isn't known, but probably is 16-20 Mhz.

Try HDX 4.01, not 4.00. It is much better at recognizing and formatting
SCSI disks of all kinds. Try switching off the MODE SENSE part during the
formatting process (there is a field for this purpose in the WINCAP file).

>Before you hold your breath for the introduction of CD-I, consider that
>Phillips has been promising it's imminent introduction for the last three
>years. Sound like any company we know? Nah.... :-)

There is every indication that consumer CD-I systems will be available in the coming months. Sony sponsors a segment on a daily radio show which promotes and provides information about CD devices. For the entire week last week, the features of CD-I were announced. The announcer didn't use generalities, but provided the actual specs for a typical system. Some of the announced details of the broad range of video mode colors: DYUV 16 million, RGB 32,768, CLUT8 256, CLUT7/RL7 128 and RL3 with 8. The video resolution is 384/768 (horizontal), 240/480 (vertical).

Philips/Magnavox recently started to provide brochures to anyone interested; just contact them at: One Philips Drive, PO BOX 14810, Knoxville. TN 37914. Phone number is (615) 521-3230.

In Europe: Philips Interactive Media Systems, PO BOX 80002, 5600 JB Eindhoven The Netherlands.

Ask for the CD-I 910 and 602 systems' brochures.

>
>Let's hope that Atari's marketing management make a better job of CD-I than
>they did with CD-ROM.

That sounds like a good development! In the US, the actual price would be around $500, I think, because hardware seems to be cheaper here. That would put the Atari CD-I in the range of regular CD-ROM drives, so instead of being limited to a niche market, it could carve out something much bigger.

Another Atari product mentioned in the online mags was a super-graphics engine based on a RISC processor that connected to the ST DMA port. It was supposed to be designed in England, so I hope some UK net readers can keep everyone abrest of its development and availability.

Thanks,
Jack

In article <LAHTINEN.91Aug11090300@gideon.gideon.fmi.fi> lahtinen@gideon.gideon.fmi.fi (Kimmo Lahtinen) writes:
>I want to know what is now the "official" way to put a pixel to screen.
>I have read form this group that Line-A is not a good idea, but I did
>not find any simple pixel routines from VDI.

first off, line A was such an easy way to do things like this without writing a GEM program. rue the day that atari took this away...

here is one way:

first, find screen size (width and height) by some means. call these scrn_w and scrn_h. assume the pixel we want to set is (x,y) where (0,0) is upper left, x,y get larger positive values toward the lower right, up to (scrn_w-1,scrn_h-1).

```
char *pscrn; /* ptr to physical screen mem */
char *pbyte; /* ptr to byte containing pixel (bit) to twiddle */
int shft; /* amount to shift mask */

pscrn = Physbase (); /* get screen loc */
pbyte = (char *) ( (long) pscrn + /* start here */
(long) y * (long)scrn_w/8L + /* goto line */
(long) x / 8L ); /* and byte */
shft = 8 - (x - (x/8)*8); /* setup mask */

*pbyte |= (char) (1 << shft); /* to set pixel */

*pbyte &= (char) ~(1 << shft); /* to clear pixel */
```

i hope i have this right. i just did this today for mgif (eliminating the use of line A totally). it works. if not, this is close...

this makes no use of line A (obviously). it only requires that u know the width of the screen. it assumes the screen width is evenly divisible by 8 (a reasonable assumption, i would think - it should be divisible by 16). note that pscrn need not be Physbase. it could be any virtual screen stored in memory.

this *should* be 100% portable, regardless of ST, STe, TT, etc. note that this is for a monochrome screen!!!! doing this for color is left as an exercise for the reader. it is not that bad, u just have to account for interleaving of the planes when getting the byte. then again, u have to deal with the color, i suppose.

>I hope it is not too slow.

well, this can be optimized. i did it this way for clarity (i hope). it should be about as fast as line A would do it, give or take. i notice no real difference in speed. you can use word offsets instead. just make sure u get the pointer correct (remember: once u cast to long, u loose pointer arithmetic so adding 1 is adding 1 byte, not 1 word).

note that it is easy to draw vertical or horizontal lines this way, but a bit more complicated to draw arbitrary lines. i think i posted ages ago a program called bez which is my (manual) screen saver. it does this trick with bezier curves. i did not write it originally, i just ported it. the origin escapes me but it was in a magazine (byte?) a couple of years ago...

Why not just backup one's hard disk (by files, not an image copy), do
a low-level format, and restore? And you get a clean unfragmented
drive in the process as well.

1947. Noisetracker Source Needed

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know if there exists such a thing as a Protracker compatible Noisetracker (a la The Empire Noisetracker) for which source code is available? I'm currently in the process of developing a game and it's intended that it should have copious amounts of wonderful music. So far I've managed to find some (possibly erroneous) documentation on the Protracker file format and the source for a Noisetracker, which I had intended to use as a guide from which to develop my own tracker for embedding within my program.

However, having spent several evenings analysing and commenting the source I've come to a couple of conclusions. 1) It doesn't work due to some (correctable) bugs. 2) It's very obscure re the techniques used in the arpeggiator, portamento up and down features and 3) it uses a lot of self-modifying code, a crime punishable by death in my books.

So, does anyone know where I might find source for something more useful? I don't intend to use it directly in my program, but with an example of a working tracker it'd make writing my own a lot easier (esp w.r.t. the translation between 4 voice Amiga and 3 voice ST sound).

Ta,

Al

You cannot use v_opnwk() for the screen, as it has already been done
by AES itself. With GDOS present, you can (and must) use v_opnwk() to
open other physical devices such as a printer.

The vertical bars are interference, and are quite normal.

Your monitor (fuzziness) seems to be caused by it being out of focus, I should get your dealer to replace it, or at the very least get an engineer to tune it up. (As I have said in an earlier article, my first one was right out of adjustment, it looks like Atari don't adjust them on the production line, they juat build them)

It's also well known that the monitor can play havoc with the TT floppy, this is because Atari decided that the monitor didn't really need any shielding, so left it off (I disagree with this as whenever I switch the TT monitor on all FM radios in the house loose their signal! The TT on it's own hardly produces a hiss).

You would have thought, as the Atari monitor is far more expensive than the competition, it would be of a very high quality, but as it is it's only really good if you get a well adjusted one.

I know of at least two groups of german developers, who have this thing up
and running. I think we will here more about that after the Atari fair in
Duesseldorf (Aug 23-25).

> to keep big screen owners happy
> form_dial(FDM_START,x,y,w,h,x,y,w,h);
> to save the screen area
> objc_draw(dialog,0,0,x,y,w,h)
> to draw the object
> ret = form_do(dialog,0)
> to handle the dialog
> form_dial(FDM_START,x,y,w,h,x,y,w,h);
> to restore screen area

Most people who are likely to use such calls will probably have spotted
this anyway, but just in case:

I think the correct syntax for the first form_dial() call should be

form_dial(FMD_START,0,0,0,0,x,y,w,h);

and the closing call should be

form_dial(FMD_FINISH,0,0,0,0,x,y,w,h);

I've used these with Laser C, but I think they are standard across all
compilers. Correct me if I'm wrong.

Wolfgang is quite right. Actually, the header information on an .img file contains two words that says what dpi the image is to be scaled horizontally and vertically. If you change these values, you will resize them. I found this out by changing the header in a picture and importing the before and after file into Pagestream. Pagestream interpreted them as pictures of two different sizes.

>I hope more information can be given on CD-RTOS...

Specific CD-RTOS information is generally only useful to manufacturers of CD-I and related equipment, because you must have a "Green Book" license from Philips to use it. However, OS-9 (which will run on the ST/TT and all other 68xxx-based hardware) information (which at an applications level is virtually identical to CD-RTOS) is available from Microware, (800)475-9000 or (515)224-1929. If you have interest in becoming a CD-I developer (get in early - remember how well Activision did as the first 3rd party Atari VCS developer?) producing multimedia software titles (games, education, reference, entirely new unthought-of applications) contact a Microware rep, who can refer you to vendors of CD-I development tools.

>Mating Microware's CD-RTOS with Motorola's M68340 super-muscular micro-
>controller sounds awesomely devastating. Supposedly, one series of CD-I
>machines will use a Signetics 68070 which is something like a 68K with
>integrated DMA, timer and I/O support.

While the 68070 was originally to be the CPU for CD-I hardware, I believe that all manufacturers will now be using the 68340 to handle the additional demands full-motion video will require. The difference between the two chips is roughly analogous to the difference between the 68000 and the 68020.

>I don't know much about the M68340, but found this info about a close
>relation, the M68332:
>...

A Motorola rep could answer this far more authoritatively, but I believe the difference lies in the support hardware (serial/timer support, etc.). Each chip is best suited for its own particular application; for CD-I the 68340 is most suitable.

Sorry if this topic is wandering a bit from the ST/TT, though those machines could certainly play a significant role in CD-I development given the right tools. Follow-up to e-mail or comp.os.os9 may be more appropriate...

Disclaimer: My company produces OS-9, CD-RTOS, and other CD-I software/tools.

>I hope more information can be given on CD-RTOS.

Since it's basically OS-9/68000, then you can drop by the comp.os.os9 group, or call Microware at 515-224-1929 (US) or 0703 601990 (UK) and ask for the "OS-9 Catalog", which gives a pretty good OS overview.

>Mating Microware's CD-RTOS with Motorola's M68340 super-muscular micro-
>controller sounds awesomely devastating. Supposedly, one series of CD-I

>integrated DMA, timer and I/O support.

I _think_ the first models will use the 68070, later ones the 68340 (or whatever else Motorola comes up with... they're creating new CD-I chips). There are already two OS-9 personal computers out now which use the 68070 and part of the CD-I graphics chipset.

>of the announced details of the broad range of video mode colors: DYUV 16

The clincher is that there are _two_ complete video subsystems with various hardware methods of overlaying them on top of each other... PLUS future backdrop full motion/screen planes. The first commercial players are due out before Christmas in the US. best - kevin

To me this message means that Atari is still supporting the DRI-RCS.

So does this mean that Atari is still maintaining the DRI-RCS-sources and
will perhaps someday manage to write an RCS that allows entering extended
object types? The current version shipped by Atari Germany is, despite
many bug reports, still buggy in this point.

>
>So I am looking for a general solution using normal system routines.

If the graphic card manufacturer has supplied a VDI driver, then the
v_pmarker() function should do what you want. This function needs the
usual VDI setup of vswr_mode(), vs_clip(), vsm_color(), vsm_type() and
vsm_height(), and will probably not be very fast, but portability
rarely is. If you want fast, you need to get the specs for your card,
and write directly too it, or download code into it if it has a co-
processor. This of course, won't be portable, so if you're selling
a program using this, you'll have to support as many cards as you can
get info on.
Before anyone jumps in and flames Atari for this, I'd point out
that this is common to any workstation supporting multiple graphic
formats. If Atari produced their own graphic card, an optimised library
would be nice, otherwise, it's really the driver writer's responsibility
to make it go as fast as possible.

super-graphics engine
|>based on a RISC processor that connected to the ST DMA port. It was
supposed
|>to be designed in England, so I hope some UK net readers can keep everyone
|>abrest of its development and availability.
|>

Um, there are rumors abound about an ATW adon board for the VME equiped
ST's (ie. Mega STe and TT) according to ST Format this board is basically
the transputer part of an ATW complete with its RISC based very high res
colour graphics processor and a number of T800 transputers. I believe the
board is being worked on by Atari UK and perehelion. According to ST
Format the price could be very reasonable to. So any guesses when this
STT (ST Transputer?) is likly to be available, if ever?

While talking about the ATW it is now available for 2500pounds with
educational discount. (Thats Half price!)

Dave Halliday.

1965. ISAAC card.

Newsgroup: comp.sys.atari.st
Date: 1991-08-12 20:52:18 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <9108122052.AA22166@top.magnus.acs.ohio-state.edu>
Source record: 229647

I just ordered the ISAAC card directly from Dover Technologies (Jay is a very helpful person). I am going to be using the 800*600 mode. I was wondering if anyone out there might have this card and be willing to give me a few pointers. I would like to know what software works, what colors you've found that look best, and so on. Does anyone know if there is a GIF viewer that will work on the ISAAC card and use the 16-color high-rez mode?

Basicly any info or tips or opinions would be nice...

Thank you much.

1966. Re: Puting a pixel to screen

Newsgroup: comp.sys.atari.st
Date: 1991-08-12 21:35:53 UTC
From: ki@opal.cs.tu-berlin.de
Message-ID: <4620@trick.cs.tu-berlin.de>
Source record: 229653

Hello Kimmo,

you asked:

I want to know what is now the "official" way to put a pixel to screen.
I have read form this group that Line-A is not a good idea, but I did
not find any simple pixel routines from VDI.

use the v_marker() function with marker type 1 (single point) and a
single coordinate pair. It is not slower than the linea call.

Hello Bill,

in your answer to Kimmo, you write:

pscrn = Physbase (); /* get screen loc */

This won't work with _any_ big screen monitor, since Xbios() functions only
return the values for a standard st/tt monitor hardware. It won't even work
with standard software bigscreens, since Physbase() returns the address
of the physical screen and not the adress that is used for drawing. Logbase()
would be a little bit better, but there will be graphics cards around that
don't share screen memory with the ST/TT... The Logbase() function would be
a Dummy() in this case.

pbyte = (char *) ((long) pscrn + /* start here */
(long) y * (long)scrn_w/8L +/* goto line */
(long) x / 8L); /* and byte */

This does not work with the overscan modification, which is installed in
over 5000 STs, nor with the reflex card or some VGA-cards. The scrn_w value
is _not_ always pixel / 8!

this *should* be 100% portable, regardless of ST, STe, TT, etc.

Please don't use it! Even if you would use LINE A you are a lot 'portable'
than using this ;-) _Never_ draw directly into the screen memory, there
are cards that have diffentent bit-layout's or the screen memory is not
accessible from the ST/TT.

Greetings,
Karsten <ki@opal.cs.tu-berlin.de>

1969. Gobs o' MIDI stuff FOR SALE !!! (gosh!)

Newsgroup: comp.sys.atari.st
Date: 1991-08-12 22:39:07 UTC
From: tod@nntp-server.caltech.edu
Message-ID: <1991Aug12.223907.23609@nntp-server.caltech.edu>
Source record: 229655
Cross-posted to: rec.music.synth,misc.forsale,comp.sys.atari.st

Hey everyone, what you've always wanted: a complete MIDI system!
(but I will part with the parts --after all: parts is parts)

Prices (descriptions follow below):

Atari 1040 STfm + stuff -- $500
Ensoniq Mirage + other stuf -- $500
Roland MT32 sound module -- $250
Dr.T's KCS 1.7 for ST -- $125
Dr.T's D20/D10/D110 editor -- $75
Kurzweil 1000 series ObjectMover-- $50
MIDImouse MT32 editor -- $50
Ulitmate Keyboard stand + shelf -- $50

Note: all reasonable/irrational offers considered. I'm parting with all of
this stuff because my loan shark, Guido, is gonna....no, actually
it's because I'm upgrading to a Mac IIci & EPS 16+ and need the cash.
All of this stuff is in real good condition (honest!) and has never
left my personal hi-tech recording studio (read: my bedroom).
I'd prefer if someone in the Ca. area bought the big stuff, but if
you really want it, go for it. However, you pay shipping.

MIDI computer: Atari 1040 STfm
---------- - 12" color monitor, 2 3.5" 720k drives, Epson RX-80 printer,
- 1 Mb Ram, thousands o' colors, good built-in sound
- built in MIDI ports (in, out & kinda-thru)
- disks & disks of software (not much organization,
but, hey, half the fun is finding out all you get!)
- but you do get many namebrand games, applications, etc.

- and lots o' documentation

MIDI software: * Dr. T's KCS 1.7 -- pro quality sequencing software
---------- - not for the weak-hearted, but really powerful
- 3 modes: tape-style mode, sequence-mode, song-mode
- MPE: Multi Program Environment supported, so you
can mulitask your brains out

* Dr.T's D20/10/110 editor / librarian
- awesome, awesome, awesome. Fully MPE compatible
(edit patches while you sequence)
- easy to use, easy to get good sounds with
- includes 6 banks (6x64 sounds) of way cool stuff

* MIDImouse MT32 editor / librarian
- cool editor prog, also friendly, easy to use
- with librarian Desk Accessory

* Kurzweil 1000 series ObjectMover Librarian
- works with any 1000 series device (PX, HX, SX)
- includes a whole slew of new sounds to play with.

MIDI keyboard: Ensoniq Mirage
------------- -awesome classic sampler, 8 voice multitimbral
(can be tricked into 16 voices)
-MASOS software --advanced sampling effects on board
-good keyboard feel (this was my master controller for
~4 years --has full velocity sensitivity,
including release velocity!)
-hundreds of sounds on bunches of disks included
-great for industrial music (samples body noises
and car crashes with zeal)

MIDI modules: Roland MT-32 --great powerful little box
------------ - like 8 synths, drum machine, & digital effects in one
- used with many compuer games

Keyboard stand: Ultimate 3-tier "A"-frame stand
--------------- -three tiers for three keyboards or use it like I did
and use third tier for computer, mixer, etc
-includes hand-made (highest quality) blackblackblack
shelf to rest computer-type stuff on
-infinitely adjustable to any tilt, position, etc.
-goes up & takes down fairly easily

There's a TT demo on GEnie, called something like STARWARS. It's pretty huge, like 800K.

>Also I would be interested in a few sound files. I've found quite
>a number of players in the binaries group, but no sound files to go

There are a couple of utilities for the STE/TT which convert the ST sounds to DMA version. (There's a name for them, isn't there? Signed and unsigned, but I get them confused. :^)

I'll send a couple to atari.archive (with a LOT of other stuff :^) when I get caught up and get a local account.

You can easiy do this with the Arabesque art package. Just load the
GEM file in the vector area then transfer it to the raster section with the
apropriate icon. Then go you can save the raster image in IMG format.

From: peter@geog.ubc.ca
Message-ID: <1991Aug13.002409@geog.ubc.ca>
Source record: 229666

I have just set up jrd's gnu emacs port (v18.55) for the ST, and have
a couple of questions I'm hoping someone can help with:

1. Is is possible to map the keypad to something useful (besides
what is printed on the keys which is not particularly)

2. Is there anyway to get it to display 50 lines of text (in mono)?
(I have set nrows 50 in gulam, and tried hi50.prg, however only
half of the screen is used by emacs)

Thanks for any help.

If some third party developers have done this then I would not consider it an
official upgrade. Official upgrades come from Atari with Atari documentation
and do not get removed when you send your machine to Atari for repair.
Any idea about what the German develpoers did to make it work?

Message-ID: <9108130959.aa23637@castle.ed.ac.uk>
Source record: 229667

Dear Netters,

Does anybody know how much (I assume its not free) the enterance fee is for the Atari show in Germany? I've written to Atari and (suprisingly) they sent me their show blurb but no hint as to how much it might cost to enter.

One other question, why does a TT cost almost as much as a decent Mac in the UK while in Germany its almost a 1000 pounds cheaper?

Herb

1979. Re: Clearing space on a hard disk

From article <1991Aug12.103711.9886@actrix.gen.nz>, by Alex.Valdez@actrix.gen.nz (Alex Valdez):
> Why not just backup one's hard disk (by files, not an image copy), do
> a low-level format, and restore? And you get a clean unfragmented
> drive in the process as well.

Because of the time it takes. A robust defragmenter will take a lot of time, too, but it should be possible for you to do other things while it gets on with it. With a full backup, you have to be there feeding floppies into the machine (assuming you don't have such luxuries as tape streamers or spare partitions).

I still haven't seen a friendly, reliable defragmenter for the ST. I've used DLII a couple of times with no problems, but you have to make sure there are no lost or crosslinked clusters on the disk, and no zero-length files. Also, I wouldn't trust it with any partition greater than 16 meg, or with large cluster sizes, or a host of other things.

There are several programs I know of but which I've not seen. I think there's a defragger by Bob Luneski, that comes with the Diamond Back backup program. In the German magazine ST Computer this June there was a demo of a defragger program that might be good (sorry, I forget its name; it's on the same disk as the demo of the awesome CyPress document processor). The UK market is really poor for this sort of software when it's offered commercially. It's hard to look before you buy. The only thing I've seen in shops or the main mail order lists is Michtron's Tune-Up (now bundled with something else). It's a shame. I'm sure that somebody could make money by importing a decent hard disk toolkit.

If you mean the Atari fair in Duesseldorf from 23.8.-25.8.91:

Last year the enterance was 7.- DM (ca. 2,5 Pounds?)

1983. Re: Puting a pixel to screen

Newsgroup: comp.sys.atari.st
Date: 1991-08-13 12:18:40 UTC
From: rosenkra@convex.com
Message-ID: <1991Aug13.121840.16027@convex.com>
Source record: 229645

hmmm... so it sounds like the only way to write portable graphics for the ST (in its myriad configurations) is with VDI, and even that might not work. thanx for pointing out my ignorance of this subject. with only a "stock" mega4/sm124 i guess i should not venture into these waters.

still, you'd think that these special graphics modifications would tap into the xbios and try and mend things. is the reason why physbase is not guaranteed to be correct because the address is out of "real" memory? is the screen memory mapped into high addresses (like $fxxxxx)? can't the driver translate this for the xbios? it sounds like any program calling Physbase won't run on big screen monitors.

the method i posted, however DOES work on "normal" STs. and i think it might work on at least some configuration of TT, tho i have no way of verifying this.

The St version is older than the MAC version so it is likely to be more stable
beside if you think you can run a MAC version on a ST with MAC emulator?
Don't think it will work, since the emulator catches MAC specific traps and
so. MINIX replaces the complete operating system so any system calls are trans
lated to the hardware directly not trough an underlying MAC layer

> the Amiga and ST binaries are compatible (under Minix) does anyone know if
> this is true for MAC as well?

Don't know about the binaries (could be) but since minix comes with complete
compiler packege it shouldn't be difficult to recompile any source

By the way there is a comp.os.minix group (or something like it) try asking them
the questions.

> as MACCEL2.

SYSINFO merely reads the cookie jar prints a build in message for each cookie
that it knows. Since both maccel2 and maccel3 use the same cookie they get the
same identification. The last version posted was posted before maccel3 so I did
not know it.

If I am not mistaken MACCEL3 was posted to comp.binaries.atari.st so
it should be in the archives. The version I am running is 3.3. The CPX module
was included in the XCONTROL archive which I found in some local BBS.
The program was not included in this archive.

Dear Netters,

Does anybody know how much (I assume its not free) the enterance fee is for the Atari show in Germany? I've written to Atari and (suprisingly) they sent me their show blurb but no hint as to how much it might cost to enter.

One other question, why does a TT cost almost as much as a decent Mac in the UK while in Germany its almost a 1000 pounds cheaper?

Herb

One thing that helps considerably in putting pixels on the screen is NOT doing them one-at-a-time. If you can save up sets of pixels of the same color, and then do a bunch at once as a polymarker, the GEM dispatcher overhead is spread out among them. And at least on my 1040ST with TOS 1.0, the overhead is the biggest chunk of time in the process.

I have to put in a good word for the backup and restore method, too. It's one of the many good reasons to get a tape unit. But to the point: Hard Disk Sentry, from Beckemeyer, is a defragmenter. It works easily, and seems about as safe as these things get. I've used it on 45 MB partitions.

Someone wrote (my reply option doesn't work and I just deleted the From line):

> So that would mean that "v_opnwk()" in Lattice C is an entirely
> bogus command! Neato! :-)

I think every manual will state that v-opnwk() is useless in a simular way
That doesn't mean that it is true.

> Conclusion #1: We need some new books put out on GEM/TOS programming.
> Hopefully, some of those books will be the manuals that come with
> these compilers.

That wouldn't be a bad idea, a book that not only list all GEM/TOS functions
but also list how to use them (not only how to call them)
The Profibuch does a pretty good job doing this but many things need to be
cleared up, most of it I assume can be found in the developpers information
from Atari but that is hard to get.

> Supposition: "v_opnwk()" is probably necessary for some GDOS commands.
> Probably I'll find this out if I ever actually use a GDOS related command.
> That's fair enough. In the mean time, I won't worry about it and I
> won't use it.

v_opnwk() is used by AES to install the desktop. It can be used from within
an AUTO folder program to enable the use of VDI aslong as the workstation
is closed properly before the program exits. If it isn't AES won't be able
the open a new workstation and exits == reboot

It seems to me it is needed for opening any workstation using another device
than the screen. In that case you will need GDOS since a driver for that device
has to be loaded and GDOS will take care of that.

If you write DIRECTLY into screen memory, this is even WORSE than using line a. There are graphics cards in the future, where there is NO way to access the screen memory (think of independant graphics systems with own cpu). Besides, you have NO information about HOW the screen memory is organized.

>this makes no use of line A (obviously). it only requires that u know the

Back to the original question -- how to put single pixels onto the screen.
Solutions:

(1) Slow: Use lines with length of 1.
(2) if you want to set more than one pixel: do it in an own buffer (as
described above by Bill), transform it to device dependant format using
vr_trnfm(), then do a copy raster form to the screen.

1997. .gem to .img conversion

Newsgroup: comp.sys.atari.st
Date: 1991-08-13 23:56:13 UTC
From: fischer-michael@CS.YALE.EDU
Message-ID: <1991Aug13.235613.6128@cs.yale.edu>
Source record: 229677

Thanks to everyone who responded to my request for help with including figures in TeX documents. One person suggested that I use postscript instead of .img files. The program mfps (included in the gem2ps collection on atari.archive) converts .gem files to postscript. The program dvips converts .dvi files to postscript and can also merge in other postscript files. The resulting postscript can be printed using Ultrascript (which I already had) or Ghostscript. I followed his suggestion and everything is working very nicely.

I am also grateful to the several people who sent me pointers to utilities that do what I had originally requested. They may turn out to be useful someday.

Source record: 229682

Hi,

in germany, anyone who has enough money for a 24pin printer and not enough for a laser is called pretty silly, if he NOT buys a deskjet. There are drivers for all programms I know, including GDOS, 1ST Word, Script, TeX (wonderfull X-Jet, print out a page in 50secs and is able to print to a5 pages side by side on a a4 sheet of paper), Hardcopy routines, utilities which switch the fonts, margins and other modes of the Deskjet as ACC. You allways can take the laserjet driver for a program as the deskjet driver (this enables calamus and other programs to work with the DJ). For the Spectre, just get the PD Deskjet driver from any macintosh archive. It`s slow (like any parallel printer at the spectre and at the original mac, the "real" porinters use apple talk like the deskwriter) but very beautifull. With the TypeAlign init or ATM, you can forget about the laserwriter, with the right paper it`s just as good.

So forget about other printers and get a deskjet. Don`t forget NOT to buy any ink cartridges until your original one refuses to be refilled with ordinary ink. For that use a injection needle to refill the cartridge through the little air hole an top of the green "arrow" with ca. 10ml black ink (Parker black is beautifull). I printed 1000 pages of TeX output without a new cartridge and refilled the old one 5 times till today.

Note: I`m not working at HP, and I have not the slightest idea of an advantage if YOU buy a deskjet.

Some of the drivers for big screen monitors do this, but they only map the Logbase() call. I know at least 1 driver that does not map Physbase(). The most drivers map the Setscreen() call, because you normaly can't change the physical screen-adress. An official test if Setscreen() works is to call Physbase(),Logbase() and save the values. Then call Setscreen() with your second screen... If Physbase() and Logbase() didn't change, it is not possible to change the screen adress. You have to use vro_cpyfm to toggle between differnt screens.

>the method i posted, however DOES work on "normal" STs. and i think it
>might work on at least some configuration of TT, tho i have no way of

Your method works in ST-High modus on the TT, not in TT-High (because BytesPerLine is different...).

The Origami folding editor (version 1.6) has just been posted to comp.binaries.atari.st. As I got some requests about what the Origami folding editor IS, I am posting summary of Michael Haard's posting in comp.os.minix which explains the principles of folding editors and ORIGAMI:

Most people probably do not know folding (outline) editors. A short example should be able to explain the principle. Imagine that you just started Origami with a folded program:

```
... Notes

... #includes
... #defines

... type definitions
... variable declarations

... main function
```

The structure is obvious, although you see no code! The program is well documented, altough there are no comments! Each line with three heading dots is a closed fold. A curious user probably wants to know what the program does. He moves the cursor to the Notes fold, opens it and finds:

```
{{{ Notes
/*

example.c - a small example

This program does not really exist, it is just an example.

*/
}}}

... #includes
... #defines

... type definitions
... variable declarations

... main function
```

Ok, let's close the fold, there is no use to look at it any longer. The next step may be to open the main function fold:

```
... Notes
```

```
... #includes
... #defines

... type definitions
... variable declarations

{{{ main function
main(argc,argv) int argc; char **argv;
{
... variable declarations

... parse command switches
... parse file arguments
... open file if any or use stdin
... process input
... close file if any
}
}}}
```

This example may serve as a first introduction. You may wonder what the C compiler says about the ... lines. It says nothing, because they are put in comments. Origami knows comments for a lot of things and the beginning and the end can be user specified, too. The advantages are obvious: Folding supports structured programming, because program structures are editing structures. Comments are part of the program, not bothering stuff. A fold can be also another file, which means that you only need one file for managing a project, which contains file-folds for all directories and files. This supports a modular structure with many files, but you do not need typing their names to edit them.

Origami is no syntax-oriented editor, it's your choice to use folds more or less. It is my favourite editor for documents, none of the $%&!@# DOS textprocessors has such a nice editor! An example:

```
... online manual page
... user guide
... changes to old version
... copyright
```

If entering (not opening, see above example) the user guide:

```
... title page
... introduction
... installation
... using it
... utility programs
... all functions
... acknowledges
```

Each chapter is in a fold, which may contain folds for subchapters etc. There is nothing like scrolling a few dozen pages if you want to edit a paragraph. Select a few folds and that's it. This helps to structure a document to improve readability. Origami, MROFF and a few minor utilities build a powerful text system, one of the first MINIX

application programs.

There are other features: Origami is able to edit TDS files without a transputer! This is the reason why there is a MultiTool-like keybinding for Sun workstations. Origami looks like Emacs and has some of its features (Think of emacs as an adjective). All commands can be bound to keys (including cursor keys etc) and there is a powerful and fast macro language. There is incremental search, fill-paragraph and auto-save. No buffers, but you will not miss them after using folds for a week.

Origami runs on MINIX PC, SunOs 4.1.1 (not 4.0!) and TOS.

You can get Origami from this european ftp-archive

Name: ftp.thp.uni-koeln.de [134.95.64.1]
Path: minix/commands/editors
File: origami.tar.Z, misslib.tar.Z

Name: ftp.uni-koeln.de [134.95.80.1]
Path: /thp/minix/commands/editors
File: origami.tar.Z, misslib.tar.Z

The files on the servers are 13-bit compressed tape archives. (I use freeze to compress things for personal use, but I do not want to start a flame war.) The posting is a uuencoded splitted copy of the files on the server. Full documentation is included.

Feel free to contact me if there are any problems. Atari problems will be forwarded to the guy who ported Origami.

If you send me mail, please send it to mhaardt@ftp.thp.uni-koeln.de
There are hundreds of reasons to do so ... but don't ask. If you make patches, please *post* cdiffs.

Michael Haardt (mhaardt@ftp.thp.uni-koeln.de)

The binaries and diffs for the minix sources are available for anonymous ftp at minnehaha.rhrk.uni-kl.de in /pub/atari/editor/origami. I will try to upload them to atari.archive.

At the moment, this is the same as the version which has just been posted - but as soon as there are bug fixes, the next version will show up on that machine, first.

And now for something completely different.

Put an end to the dominance of IBM and Apple.
Put an end to the irritating articles from frustrated Amiga users.

The solution to these problems we all experience might be invented by
me.
Atari and Commodore should become one big company that makes
interesting computers and software.
They both have a line of Motorola 680x0 based computers and they both
run a lot of the same software. It would be better if software did not
have to be ported to two computers. If e.g. an Atari ST and an Amiga
2000 both run Minix they can even exchange binaries. Also Atari and
Commodore have for some part a common history (the Tramiel boys etc.).
They started their line of homecomputers both with 8-bit 65xx machines.
And it would bring down costs for development of new computers and the
costs for the purchasing of new technology.

It seems to me that these should be enough reasons for implementation
of my idea.
Lets hear your flames...

P.S. sorry but i do not regularly post so no .signature...

Greetings from Erlend 'Error' Nagel

2007. Official Bug Report for The Vault

Newsgroup: comp.sys.atari.st
Date: 1991-08-14 13:21:13 UTC
From: fischer-robert@CS.YALE.EDU
Message-ID: <1991Aug14.132113.13139@cs.yale.edu>
Source record: 229688

A couple of bugs in The Vault 3.01 have come to my attention:

* The Vault tends to crash on deeply nested directory trees. This is
a very serious bug, and will be fixed in the next release.

* When running on TOS 1.2, The Vault displays an alert box saying
"Illegal Function Number" upon startup. It is making an AES call
which wasn't added to TOS until TOS 1.4. This is not a serious bug,
and The Vault functions just fine in spite of the illegal function
call at the beginning.

Thank you to the people who have found these problems.

>
> One other question, why does a TT cost almost as much as a decent Mac
> in the UK while in Germany its almost a 1000 pounds cheaper?

My guess is that Atari Germany expect to sell machines to real users. Atari UK, on the other hand, expect to sell TTs only to a few developers who can be considered more or less a captive market. It's not worth Atari UK's while to shave their margins. They're not going to give the TT decent marketing support anyway, so why bother.

Sorry to be so cynical. Yes, I do know that Atari UK show the TT as one of the range of machines in their current ads in magazines like ST Format and ST User. The picture shows a man in a business suit sitting in front of a TT running Hyperchart. I would be surprised if the number of ST Format/User readers who fit into that sort of category reaches double figures.

2012. Atari earnings

Newsgroup: comp.sys.atari.st
Date: 1991-08-14 16:05:18 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Aug14.160518.24023@chinet.chi.il.us>
Source record: 229695

Atari's earnings were just printed in the Wall Street Journal. The plant sale was so much bigger than anything else that a meaningful interpretation of the report would take a lot more information than the little bit in the announcement. Two things were noticeable, though: sales were off again, and they seem to have gotten a better price for the plant than originally reported (about $40 million, rather than mid-30s). At heart, I don't think Atari is a real estate company, so the future depends on a supply of machines that people want to buy.

2013. Re: ORIGAMI folding editor - what is it ?

Newsgroup: comp.sys.atari.st
Date: 1991-08-14 17:15:10 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1991Aug14.171510.22315@csi.uottawa.ca>
Source record: 229696

First comment:
VERY IMPRESSIVE! Thank you for your work on ORIGAMI! I was
considering to try to port it using Sozobon, which looks like it was NOT
a wise idea... and now, wholly unnecessary. The GEM interface is VERY nice!

A couple of questions:
1) Would it be possible to put the keybindings for the menu commands
on the menu? Read the bindings, at some point, and stick them
in? Or is this impractical? T'would be VERY helpful in learning
the keystrokes...

2) (Question about commenting for other languages deleted as
I found material in the docs. on it. I WILL have to check out
how TeX files are dealt with - I THINK that there's no
"Begin-comment/End-comment", but rather the single "%" identifier,
but I'll have to check that out...)

Again, THANK YOU! Very nice package - I will, most likely, be using it
as my primary editor, particularly if I can customize it to auto-link
to LaTeX files (i.e. - Do a file-fold simultaneously to putting an
\input{} in).

>can you really buy it somewhere?

>By the way am I correct that it is based on Mach kernel?

Ahm, no, I don't think so. As far as I know, it is a port of
AT&T System V R4 (SVR4). According to people at the diverse
fairs I visited, SVR4 was ported instead of SVR3.2 because
they wanted to provide a very modern UNIX as a reimbursement
for being so late with the TT.

So long,
Martin

>Calamus without anytrouble.

OK, OK, .img files can be any resolution. The point is that once you have an .img file, you are stuck with that resolution. If you need to rescale the image, you have to deal with the problems of this fixed resolution. In some cases this can't be avoided (like with your 300dpi scanner), but PostScript graphics do not suffer from these problems. You can enlarge the image by a factor of 2 and still get 300dpi (or a couple thousand dpi if you have an expensive printer, or a nearby printshop). With GhostScript, mfps, and dvips, you can enjoy the benifits of PostScript on your ST ... for free.

Hmm,if you can't find any special link things that would work
for you, how about a simple null modem? Then you could use any
term program (preferably something with Zmodem) and then just
transfer away (of course, you'd have to create the folders,
but at least it would be a simple and rather inexpensive way to
do it).

Hope this helps...

Source record: 229506

Well, I have been using UW for a while now. To set it up, you must compile
the unix source code on the unix system you intend to use it on. Then simply
run the uw prog on the st. Make sure you configure the RS232 port in uw to
you correct setting. Then simply use hayes commands from the first window
uw pops up to dial your unix system, log in as usual, then run the uw executabl
e on the unix side. Now you will be able to open additional windows etc from
the st side of things. Remember though, that it is adm31 emulation.
With a good use of defining the function keys on the st you should be able
to connect to non unix systems (I use vm though uw in another window) and
get pf keys etc by binding the function keys to their appropriate codes.

Good luck

Sorry to use bandwidth - I can't get mail to timothy@yoda etc.
So here is my reply to you!
I put gs22b onto my h/disk. I set up the environment ok, I believe.
When I trun gs for bj10e it works fine with pure graphics (eg: golfer),
but with fonts it won't work. If any font is in the .ps file, nothing is
output.
If i do the same with epson, it produces output.
Also, it produces screen images ok, but nothing when using bj10e option.
I'm using the fonts from atari.archive.
So I guess the grtaphics part's ok, but bj10e is a bit suspect!
Is it because I have only 1meg of memory?

I agree. The only people buying TT's seem to be developers and Atari fans
with more than normal amounts to spend.

>Sorry to be so cynical.
Don't be. You're not alone.

> Yes, I do know that Atari UK show the TT as one
>of the range of machines in their current ads in magazines like ST
>Format and ST User.

Readers of which know all about the TT. The readers of PCW however remain
ignorant of it's existance and so show no interest. When will Atari learn?

> The picture shows a man in a business suit sitting

I think the 'man' is actually Bob Gleadow playing an Alfred Hitchcock role
by starring in his own brochures. Presumably he is also the man who hired
Staddon based on his ability to play Kick Off. :-)

Since most ST Luser/Doormat readers are game playing kids I reckon Luser must
have had a hard time finding a serious user to give the TT to in that
competition a while back.

>Gotta move my data from my Mega4ST to my TT. Anyone know of a lap-link type
>program that would work for this? 40MB is a lot to move by floppy...Thanks

To extend the question...

Does anyone know of a circuit or product to connect up a bunch of Atari computers in a DMA network? Each computer has its own hard disks and other peripherals but they also talk to each other over the DMA bus. I know there are negative as well as positive implications involved with this kind of setup, but it could be real useful where several machines are in the same room. The reason for using the DMA instead of the cartridge port is because it is less likely to be full.

Anyone like to discuss this?

-Adam David-

I have thought about that. I have no idea how to do it flexible enough
so that it works if you change the keybindings (without major hacks in
keybind). If you have an idea, I will most probably do it.

> 2) (Question about commenting for other languages deleted as

Origami comments always end at the end of line. So you can simply use
'%' as start-of-comment and '' (nothing) as end-of-comment. Same is for
assembler, shell scripts, ...

Have ever tried Ataries Check Disk 3, it is only given to developers
so far, but why can't Atari realese it for general use.
.
I have used it and it works very well, but only optimises for Read.

Also have you used the Atari Archiver Program, ? I think is a UK product.

>They started their line of homecomputers both with 8-bit 65xx machines.
>And it would bring down costs for development of new computers and the
>costs for the purchasing of new technology.
>
>It seems to me that these should be enough reasons for implementation
>of my idea.
>Lets hear your flames...
>

The problems with if a merger between Commodore and Atari took place, are:

1) Which line of 16/32-bit computers to continue? ST/TT or Amiga?

I don't want to switch and neither do Amiga owners.

2) I can almost bet you that Jack and his sons do not like many people
at Commodore. I'd be surprised if they talked to each other let alone
reached a merger agreement.

3) I think these companies enjoy rivaling each other and it produces some
excellent technology from both companies.

But seriously, get real- it will never happen.

Currently System 7 does not work on Spectre (any version). It's in the hands of Mr. Small as to when it will work. This is a major system revision with many things changed so it might take him awhile but this is Dave, so it'll be done.

2039. Lasar C on a TT

Newsgroup: comp.sys.atari.st
Date: 1991-08-15 21:10:10 UTC
From: aking@bbn.com
Message-ID: <65806@bbn.BBN.COM>
Source record: 229523

How do you get Lasar C's compiler to run on the TT? I've been told it will, but the following avenues haven't work:

1) Using the TT's desktop, the environmental variables aren't set properly. How do you do that? Playing around setting the_envp in low-memory (around 4CA or so) does nothing. Perhaps I must learn pexec and write a launcher, but there has been much discussion on that in the past which I have forgotten and scares me off. Wasn't there a program to do this floating around around a year or so ago? Does it run on a TT?

2) Both Gulam and NeoDesk-CLI allow setting of environmental variables, but both have a funny problem with make -- they can run make, but make can't run cc.ttp. I've put in absolute path names everywhere, put everything in one directory, and still nothing. If I put the cc.ttp commands in a batch file, same problem.

3) If, under Gulam, I call ccom.ttp and link(is it?) directly, things compile. However there are two problems with linking: a) there is a command line limitation which makes it difficult to link my 20-odd files together, and b) cc must do some magic with libraries which I do not know about, because I suddenly get gobs unresolved (library) symbols.

Tantalizingly close, but no cigar. HELP!

Please email answers to aking@pebbles.bbn.com as my workload prevents me from reading the net this summer. I'll summarize to the net if a couple of people ask me.

Thanks

Allen King

P.S.: What is a good EMACS to run on the TT in TT-Medium or ST-high resolution mode? Where is it living on the net?

>can you really buy it somewhere?
Not now, allthough Atari promised the first machines to be delivered to
some selected registered developers in April (that's what they told me
on CeBit 91).
The Unix-TT (or better, TT-X, as Atari called it) is an TT030/8 with a
200 meg harddisk, 19" monochrome monitor, Unix SYSVR4, C-Compiler,
some kind of window system (I think it was Motif/X11) including developers
tools (must be something like the Open Windows Guide from SUN).
The price was something around 8000 DM (4500-5000 US-$) incl. VAT.
All information without guarantee....

[personal opinion on]
If the price and the technical details are right, it's the cheapest Unix
machine I've ever heard of. Add another 4-8 Megs of Ram and about 200 MB of
hard disk space and away you go...

Well why not just connect the Hard Drive from the Mega to the TT, then use
a Program like Cheata 3,? , or some thing like that, that can move files very
quickly.

Or is this a internal drive.?

Why not just connect the drive to the TT and use a CLI to transfer the files
recursivly and then go for a coffee. BTW if the HD is internal why not take it
out and connect it to the TT's SCSI bus.

Why not connect your hard disk to the TT?

I realise that if the hard drive is an internal one, then this isn't possible.

The port on the TT into which to plug the ST hard drive is the one called DMA or ASCI in the TT manual (The 15 pin one near the floppy port).

Steve

Hi!

I am a bit confused at which files I need for the newest GCC for TOS.
Actually, I want to have a TOS cross compiler on Unix. I do have the GNU
GCC 1.40 distribution sources. And I have the mint libraries (v 10).

Any help is highly appreciated.

So what? You can go out right now and buy a 21 MIP Sun SPARCstation ELC for the same price in the US (about US$5,000). Wouldn't it be better to own a SUPPORTED workstation that runs a real unix and that you could do real development work on?

Regards,

Chris

p.s. That $5K figure is LIST price, not educational discount. That is probably even much cheaper.

2051. TT pricing

Newsgroup: comp.sys.atari.st
Date: 1991-08-16 17:27:20 UTC
From: eang62@castle.edinburgh.ac.uk
Message-ID: <9108161727.aa29240@castle.ed.ac.uk>
Source record: 229531

Dear netters,

Thanks to all those to let me know how much is was to enter the Atari August show in Germany, much appreciated.

When I saw the Atari UK adverts in the British mags I too thought it was rather strange to target the TT at men (or women) in business suits (+ Financial Times and a very nice fountain pen). Why on earth does a buisness man need a TT, after all they only need a spreadsheet with a big red button marked SUM (i.e ADD!) and an ability to do very pretty pie charts and histograms. I've been interested in the TT mainly because it would make a nice machine for doing number crunching since it has a floating-point processor built-in (which I think is an excellent idea). I am fed up with PC's coz' of their brain damaged memory, Macs are OK but for the fact that they're not really development machines so that leaves the Amiga or Atari and since I had an ST it really boiled down to the TT. But, they've priced it out of my reach!

The Next is an interesting machine to consider because the educational price of a Next is not that far from an 8MEG TT and for the price its an absolute bargin of a buy. If on the other-hand the TT were priced more in line with German prices then the TT would be much more enticing. Now if someone were to buy a load of TTs from Germany, plug in some British ROMS + a British keyboard.....

Herb
Edinburgh.

>estate company, so the future depends on a supply of machines that people
>want to buy.

Steve,

I have seen the earnings report too. It isn't good. A computer company
cannot survive unless it sells machines. Atari's sales as you have noted
above, have again decreased. They are quickly losing their market share in
Europe now also.

The lionshare of the "earnings" they reported were the result of savings
due to repurchasing some of their existing debt and the sale of their
plant in Taiwan. A useful analogy here would be:

TWA reports an increase in earnings. However, those earnings were due
to the fact that they sold off 5 747's (a source of revenue) and some
of their landing slots. They had less customers this year, but hey,
they made a little money on selling thos planes, eh? Who cares if people
prefer to fly United now?

While this is intended to be very sarcastic, it isn't THAT far from the
truth in this case. Just check out the price of Atari stock to see how
much investor confidence there is in your favorite computer company.
I think it is hovering just over $2/share. Gee, that is just where it has
been since a year ago...what a coincidence. :-)

Cheers,

Chris

I also read last night on GEnie that Dave is VERY seriously considering
going after the 256K ROM emulation. He had put out "Feelers" about a
month or so ago as to how much interest people would have in the 256K version
and WHY they wanted it. Putting out "Feelers" was much the same way that
the 128K Spectre and the SST board came about being done. He did state that
color MAC support (Color Quickdraw) could only be supported on 68020's and
above (read: maybe the SST), though he didn't say for sure that he would
be trying for that.

I remember reading "way back when" and article by Dave Small in which
he said that Apple made it VERY difficult to purchase 256K ROMS. Since
his Spectre relies on the buyer being able to plug in Apple ROMs, it isn't
surprising to me that he hasn't supported this yet. He is walking a very
fine line with Apple when it comes to litigation. His operation is small
enough that it would take VERY LITTLE effort for Apple to put him out of
business so I can see why he is being very careful about this. He even
put in code to try to detect EEPROMS with illegal copies of 128K ROMs
in the hope that it would keep pirates from directing Apple's anger at
him. I don't blame him at all.

Cheers,

Chris

2056. Atari Sales

Newsgroup: comp.sys.atari.st
Date: 1991-08-16 17:56:47 UTC
From: cmm1@cunixa.cc.columbia.edu
Message-ID: <1991Aug16.175647.17123@cunixf.cc.columbia.edu>
Source record: 229539

It is worth noting that Atari's sales in their most recent earnings report was only about 58% of the sales for the same period last year. That sounds like a dramatic drop off to me.

So how does one report sales of $49.2 million and net income of 30.4 million anyway? Especially, a company like Atari??? I smell some "creative accounting" practices here.

Cheers,

Chris

Aren't the 256K ROMs even harder to get a hold of than those 128K ROMs are
now? What good is a new cartridge to use it if we can't get the ROMs?

Dave Small has been looking into the new Mac ROM clone chips being designed by NuTek for their clone systems. NuTek has said publically that they make their chips available for other clone makers that were interested, so if they actually do get them out, Dave should have no problem using them for the "Spectre 256".

On the subject of the new chips, I heard that they will have the Motif user interface instead of Finder (along with a few new calls for other great features) while still retaining all compatibility with the previous and current ROMS. From what I read in MacWorld, they are pretty close to completion. Their lawyers are working at full steam to keep Apple from shutting them down. Apple really doesn't have any legal ground to stand on in a case against NuTek, however.

2061. diffs for GNU make 3.59

Newsgroup: comp.sys.atari.st
Date: 1991-08-17 02:31:56 UTC
From: rosenkra@convex.com
Message-ID: <1991Aug17.023156.9644@convex.com>
Source record: 229544

if anyone has diffs for GNU make 3.59 for gcc on the ST, could you
please send them to me? i have the (an?) executable, but wish to tailor
it to my environment. i have original source from prep.ai.mit.edu.
the version i have tries to spawn /bin/sh if it detects redirection
(i think). otherwise, this version seems fine, at least for my KISS
makefiles. i got the ttp from atari.archive.

also, can i make a general suggestion that if hard-coded paths to
executables and other files (make needs /bin/sh, appearently), that
we adopt a more favorable policy to make patching binaries possible?
for example, if you have:

```
char *file_name = "c:\\bin\\xxx.ttp";
```

that you instead use:

```
char *file_name = "c:\\bin\\xxx.ttp\0 ";
```

the \0 after the string truncates it and the spaces provide patch space.
include at least 64 total chars of space. this make life MUCH easier for
binary patching if u either 1) have no time to recompile, 2) don't have the
necessary tools to compile, or 3) don't have the skills to compile. sometimes
i find myself in all 3 categories :-).

thanx...

>
> Thanks,
>
> //richard

I have tried this program and it effectively allows you to link up
two ST's. It is a followup to Anet, which used RS-232 and didn't
exceed 19200 bauds opposed to Midi's 57600.
When you launch it on each ST, you can then install x more disk drives
on the desktop (x being the number of drives the other ST has, for
example: A:,C:,D: = 3 more drives), following those existing on
YOUR machine. For example, if you were to have two floppies A: B:
and one hard disk, C:, you would install D:, E:, F: as the 3 drives
from the remote machine.
It is fairly reliable, but is more of a gadget, since even the lamest
floppy disk drive works at 147000 bauds on local, what's the use of
going 1/3 the speed?

Bye

2065. Re: Using the ST with a Deskjet

> depend on whether the Deskjet emulates Epsons)
> Finally, what about ATSpeed? Anybody know?
> Thanks very much.
> -Gerry
> ggreenbe@rodan.acs.syr.edu

For ST, I don't know if there are many drivers for TOS itself,
but under SPECTRE (and Mac, incidently!), there exists a driver
which I have in my possession, enabling you to use a DeskJet as
a LaserJet II or as a SLM 805/605 Atari laser printer.
Works fine with ATM and True Type!
As for ATSpeed, there are lots of DeskJet drivers for many applications.

Bye!

2066. Minix?? Unix on ST??

Newsgroup: comp.sys.atari.st
Date: 1991-08-17 15:44:40 UTC
From: unknown@disk.uucp
Message-ID: <1991Aug17.154440.18261@disk.uucp>
Source record: 229551
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can anyone help me out here? I own one of the first 520ST's with TOS in ROM (tos 1.0) and I haven't had access to usenet or any major atari news for a few years.. If my questions take too much bandwidth to answer then please mail me, but I have a feeling that others would also appreciate these answers..
First, What is minix? Is it PD? And I've seen some message that said you could run amiga and atari st binaries? Is that true? And can you run unix? is it included? How compatible are all these things?
Second, what are the absolute best programs (PD and other) that would be good to get? I need to get my ST up to date. I'm considering a 520 to 2.5 meg upgrade, but I'd like to know what's out there..
Third, I've read in magazines that Dave Small had such a problem with people copying a software mac emulator that he made older versions PD.. Is this true? And where can I get PD versions of it?
Fourth, Is there a good PD (and ANSI standard compatable) Personal Pascal editor/~rc}
gIo?'Fompiler? I have Lattice C for the ST, but next year in Highschool I'm taking a class on pascal, and I'd like to be able to continue my work at home.. Thanks!!
Also, anything else that an ST user should know, please tell me! Like, how does one get a TOS upgrade to 1.4 or whatever the highest version is? Is it on disk, or cartridge?

The best and official way to check such things is to examine the contents of the cookie jar. You can find everywhere programs and source code to look in this jar. If you need more help post a question to comp.sys.atari.st.tech!

2069. Personal Pascal VS. Modula - 2

Newsgroup: comp.sys.atari.st
Date: 1991-08-17 22:54:30 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <JTiu72w164w@ersys.edmonton.ab.ca>
Source record: 229553

Hello. How does Personal Pascal compare to Modula - 2 (the TDI version) in terms of compiler efficiency? I've written a program in Personal Pascal that uses entirely too much memory, and I think converting it to a different language (one that I have) will result in a program that uses less memory. Modula - 2 is the closest thing I have to Pascal, which will make for a less painful conversion, so that is what I am hoping to convert it to. Any ideas?

2071. TT printing

Newsgroup: comp.sys.atari.st
Date: 1991-08-18 03:05:46 UTC
From: glenn@ludwig.sharebase.com
Message-ID: <9108180305.AA10318@ludwig.sharebase.com>
Source record: 229554

So, I finally got my TT030! My current programming project gets loaded on, and runs slower than on my Mega...until I rework the memory allocation to fast RAM, and then it generates a complete screen of graphics before the Mega starts (given simultaneous commands) to even update the screen. All is wonderful...until I try to print.

Even from the Desktop, double-clicking on a text file, it says printing that file, delays proportionally to the length of the file, and quits.

Nothing appears on paper. I test the printer from another computer (1040 ST), the printer works fine. I try the computer with another printer, no difference. Both printers work fine with the ST. Neither works with the TT. I try a shorter cable, still nothing. Printers are Epson GQ3500, Toshiba 341. Desktop printer configuration is to the parallel port. Any clues?

2nd problem: I plug the modem cable in to write this message from the TT. As I do so, I hear a disheartening disk spin down...the modem port is right under the power cord, and apparently jiggling the power cord caused either a short or an open...and it wouldn't turn on for several minutes after...I eventually, after delays and more jiggling got it to turn back on. Anybody else seen this?

2074. DC (formatter?)

Newsgroup: comp.sys.atari.st
Date: 1991-08-18 09:31:33 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <165521@unix.cis.pitt.edu>
Source record: 229557

I thought of a very useful utility that maybe one of the Double-Click programming masters can create - a Background formatter. What do I mean by this? Well, there is an IBM program I found at msdos.archive called CNFMT106 that is a TSR program. When a chosen hot-key is pressed, a "format?" menu pops up - after you choose the format you want (5.25, 3.5, 720k, etc) it begins formatting and drops you back to DOS until it is done. When it is done, you can have a window pop up telling you so. The nice thing about this kind of a program is that you don't spend the entire day watching the computer format disks -- the IBM version for example worked fine behind Word Perfect, etc. Although the IBM version doesn't seem to work under PC-ditto, not did it seem to work under the Supercharger (maybe it has something to do directly with the drive?).

Anyways, hopefully an ST version is possible (sure would save alot of time). Best bet would be to try the IBM version, and work from there.

Well, that ought to keep minds frying for awhile....

Message-ID: <1991Aug18.122626.18630@forwiss.uni-passau.de>
Source record: 229558

Hello out there,

last week I called ATARI Germany in Raunheim. I asked ,if they know the
problems, which are familiar on the net. And what a supprise, they said,
that they know the problems. But there are no plans, how to get them fixed.
So we have to wait.
The problem of "flipping screen" is perhaps not only a hardware problem.
Today I checked the machine-code of the programs, where the problem occures.
As you know the screen flipps only on the left, when you switch the screen
to another. So there are two ways to make this:
- take XBIOS(5) SETSCREEN
- or adress directly the screenadress.
The best way is the first one. The second oner can make problems.
I searched for any xbios(5)-calls, and couldn't find one. So I think
the problem occures only if screenswitching is not made by system-call(xbios(5)).
Please check too your programs and mail what you have found. I make a summarize.

Good luck to all, Christian.

|>ELC for the same price in the US (about US$5,000). Wouldn't it be
|>better to own a SUPPORTED workstation that runs a real unix and that
|>you could do real development work on?
|>
```

Yer, but you can't compare prices on your side of the Atlantic to thouse on ours. ELC's arn't available here yet and the SLC costs 5000pounds with educational discount. (I know I have just got one for work.) so assuming the same ration then the ATW would retail in the states with educational discount at about $2500. (Which is not bad for 4xT800 transputers.) You are right about Helios though it is still a bit on the buggy side.

Dave Halliday.

Ps I don't realy expect the ATW to become a mainline product in the US or here in the UK for that matter. It is mainly treated as a research tool.

2082. Problems using Overscan with SM125

Newsgroup: comp.sys.atari.st
Date: 1991-08-19 06:38:35 UTC
From: otti%megatel@unido.informatik.uni-dortmund.de
Message-ID: <1991Aug19.063835.204@megatel>
Source record: 229562

I just got the overscn3 package from terminator and liked it that much that I took my wiring iron and did that litle modification to my 260ST (not the latest model, I guess :-)).

There wasn't much to do, since most of the stuff was installed by my hardware dealer years ago to enable the composite sync signal. So I think I couldn't have done much faults connecting the switch to the rest of it. But it doesn't work. The overscan software seems to recognize the position of the switch but all I see are some strange bit patterns and vertical lines. The bit patterns are changing when I use the *,/,+ and - keys, but not to something sensible. I'm using TOS 1.4.

Does anybody have a suggestion to fix that problem ? Has anybody experience using overscan with a SM125 (I think it's a english model and it's rather seldom here in Germany) or does the SM125 has other specifications than the SM124 making it unusable for overscan ?

Thanks it advance

Last update: 19 August 1991
Author: David Paschall-Zimbel (davidli@simvax.labmed.umn.edu)
Comments and suggestions welcome.

Note: I will be revamping this publication for October 1991. If you
have a 'frequently asked question' you'd like to see included (answers would be
helpful too :)), send me e-mail. Comments and suggestions on what bits might
be left out (or added, or changed) are also welcome.

DIRECTORY (new articles and articles with changes are marked with an '*'):
You may search for the capitalized keywords to find the related article.

WEL
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Jeff Weiner will only forward them to Jon, so please save him the time. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

The mail server has also moved. Send an e-mail message to

info-server@ftp.Informatik.Uni-dortmund.DE

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be a valid internet or uucp address. For bitnet users name@host.BITNET usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive, compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl26.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5

```
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

```
Number
Description of bombs
=========================================
Reset: Initial PC2..............1
Bus Error.......................2
Address Error...................3

User Interrupt Vectors......64-255
```

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordFlair, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

HAM
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.1) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran

by newly acquired SIG Operator, Peter Haller, a professional programmer
who is running developer sections on hardware and software development,
programming, MIDI applications development, Graphics Design,
plus many other sections that can definitely become a programmer and
developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured
Product Info and Support Board and a new Special Applications Board.
The Support Board includes a vast library of support lists. These lists
range anywhere from phone numbers of Atari dealers and producers, to
software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software.
To sum it all up this area covers what's out there, who makes it, and how
to get it for all Atari products. The Special Applications Board is
just starting out. Currently there is an area for users of MIDI on the
ST. MIDI users are encouraged to use this as a means to discuss MIDI
related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it
via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu"
or by calling (216) 368-3888 300/1200/2400 bps. Once on the system,
a user can apply for an account application and logon as a visitor.
Once here, simply type "Go Atari" to get to the Atari SIG. A visitor
can go anywhere on the Freenet and can read anything. They can't
post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair
Atari SIG Public Relations

Internet e-mail: aa338@Cleveland.Freenet.edu
CIS e-mail : internet>aa338@Cleveland.Freenet.edu

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost

of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews, or more information on other magazines, please send them to me via e-mail. As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free [$6.00/50 magazine shipping charge] from participating computer dealers, bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year) Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine (Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people.
Lively, but of uneven quality. Big leisure section, but other areas
covered too. Includes cover disk - mix of games demos and (usually out
of date) PD utilities. Probably the biggest-selling UK ST mag. Has had
several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper
(monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2,
D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

>yup, I've heard there were several Atari ST Dealerships in the nyc, but only
>know about j&r records/computers/etc.

J & R is the only non-music store that I know of that sells ST equipment in NYC. Several music stores (there are a lot on 48th and 49th streets on the West Side. Try Manny's Music. Also, there is Leigh's computers which is on 83-84th and 3rd Ave. Don't expect good prices though unless you buy at J&R. The problem at J&R will be getting them to stock the equipment you want. They don't sell too many STs compared to Amiga and Messy Dos machines so they don't keep too many units on hand. You might have to wait a while for what you want. Also, don't expect the salesman to know anything about the ST. He/she'll probably try to convince you to buy an Amiga (which might not be a bad idea anyway depending on what you intend to do with the thing).

If you need more info, don't be bashful. Send me email and I'll see if I can point you to the rights spots. After all, I WAS an ST owner for almost 5 years.

Cheers,

Chris

Message-ID: <1991Aug19.145212.18256@magnus.acs.ohio-state.edu>
Source record: 229568

I agree with that. I would rather see an in-business GCR producing company, than a company that makes a great 256K emulator and then gets sued out of business. However, if he follows the same principles as before he should be OK from what I've heard from legal-type friends. As long as he does not actually sell the ROM's himself with the emulator then it would be very difficult to take legal action (note: I may not know what I'm talking about here, I'm, just repeating what I've heard from others...).

I have to admit I would love to see a 256K version with Color for the SST or TT. However, the TT does not support Mac-Quality color, so how would this be done? It seems like the task would be very difficult since he would have to support lots of different second-party cards in order to get the true Mac color mode (256 colors out of 16mil at 640*480).

Anyway, more power to Gadgets if they can pull this one off, it would sure be a great tool for the Atari World.

>Any idea about what the German develpoers did to make it work?

I am one of the developers, I did the software-modifications.

YES, the modified TOS 2.05 runs fine on any ST and YES, TOS is copyrighted by Atari. We should instantly stop talking about a project that is not yet finished. We're looking forward to meeting Atari on the Atari Fair in Dusseldorf and we'll have lots of things to discuss that should not be discussed in the public before.

Maybe we can say more about all of this in a week.

2088. For Sale: CRICIT Cash Register & Inventory Control Software

Newsgroup: comp.sys.atari.st
Date: 1991-08-19 16:08:31 UTC
From: payman@casbah.acns.nwu.edu
Message-ID: <1991Aug19.160831.12166@casbah.acns.nwu.edu>
Source record: 229569

I have a nice Cash Register and Inventory Control Program (called CRICIT) that I bought 2 years ago for over $300. You can hook up your ST to any triggered cash drawer, and make it work like a cash register. All invoices are filed and can be recalled at any time. Mailing lists are automatically created. It can keep track of 65000 different items in your inventory, and automatically creates a purchase list. Plus, it does barcode labeling on your printer and reading (with an optional barcode reader.) You can design customized inventory reports, and sales reports. It's a very useful package for any small (or not so small) business.

My father no longer has the business at which he used CRICIT. So I'd like to sell it.

Make me any offer !!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

unknown@disk.uucp (unknown) writes:
> First, What is minix?

A mini-UNIX for ST, PC, Mac, and Amiga. It's a clone of v7 UNIX, completely re-written from scratch; it's now migrating towards ANSI C and POSIX compatibility. You get a proper multi-user multi-tasking UNIX-compatible operating system with full source code for everything except the C compiler and one of the editors. (You can get the sources for a compiler and for the editor via the net, so that's not too much of a problem.)

> Is it PD?

No, although the license agreement is one of the least restrictive I've ever seen. (Full marks to Prentice-Hall!)

It's about $180. I've just switched from TOS to MINIX and I consider it to be worth every penny... Be warned that it's a hacker's OS; you are expected to know quite a bit about UNIX and feel happy playing with the source code of your OS.

> And I've seen some message that said you could run amiga and atari st
> binaries?

You can run Amiga and Atari ST *MINIX* binaries on either system. You can't run GEM/TOS or AmigaDOS binaries. MINIX is an entirely new OS which completely replaces TOS/AmigaDOS.

> And can you run unix?

It *is* UNIX.

> Third, I've read in magazines that Dave Small had such a problem with
> people copying a software mac emulator that he made older versions PD..
> Is this true?

It's true that people were copying it.

> And where can I get PD versions of it?

I wouldn't bother. You'll need 128K ROMs to run almost any good Mac software these days, and for that you need Spectre.

> Fourth, Is there a good PD (and ANSI standard compatable) Personal
> Pascal

There's a Pascal from HiSoft which claims to be compatible with Turbo 'Pascal'. There are various other Pascals, but I don't know of any standard Pascal for the ST.

> Also, anything else that an ST user should know, please tell me!

Er... that an Amiga is fifty billion times better? <--- joke

> how does one get a TOS upgrade to 1.4 or whatever the highest version is?
> Is it on disk, or cartridge?

It's on ROMs. You have to take your ST to bits with a screwdriver and
pliers.

2090. GS 2.2

Newsgroup: comp.sys.atari.st
Date: 1991-08-19 17:16:22 UTC
From: jeffy@lewhoosh.umd.edu
Message-ID: <9342@umd5.umd.edu>
Source record: 229570

I've been playing around with the GhostScript 2.2 binary that was recently posted to atari.archive. I've got most of the fonts set up and everythings working beautifully (well, as much as one can expect with only 1 meg of memory) but I'm having problems with the DeskJet driver's output. For some reason the printer is inserting several blank lines at the top of the page, so that a single page of output requires 2 pieces of paper.
The guy who ported 2.2 to the ST (who apparently can't be reached via e-mail 'til next week) states in the ST docs that the DJ driver has been tested so I tend to think that the problem is something on my end...though I have no idea what. Anybody have any thoughts, suggestions, or experiences with the same problem?

Thanks,

Jeff

This is true. Dave could have an airtight case, but Apple still has the
resources and the trackrecord to get him out of business (by legal attrition)
if they feel threatened.

>from what I've heard from legal-type friends. As long as he does not actually
>sell the ROM's himself with the emulator then it would be very difficult to

Again, I agree with you. I think he could only support mono unless he
included a lot more hardware on the cartridge.

>
>Anyway, more power to Gadgets if they can pull this one off, it would sure be a
>great tool for the Atari World.

This is absolutely true. Dave Small is probably responsible for more ST
sales than any other single developer or group of developers. Most of the
STs that are owned by friends of mine are used almost exclusively for Mac
emulation and this was a major selling point when they bought the machine.
Compared to the comparable Amiga Mac emulator, the GCR is the best thing
since sliced bread. As a matter of fact, I would be happier to see his
proposed SST outsell the TT, as I think the support by Gadgets has Atari's
support beaten hands down. In short, Dave Small has the talent and
commitment to his customers that we only dream to ever see from Atari. He
deserves every $ he earns and then some.

Cheers,

Chris

2092. Re: TT printing

Newsgroup: comp.sys.atari.st
Date: 1991-08-19 17:59:17 UTC
From: apratt@atari.UUCP
Message-ID: <3025@atari.UUCP>
Source record: 229576

glenn@ludwig.sharebase.com (Glenn Linderman) writes:

>So, I finally got my TT030! My current programming project gets loaded on,
>and runs slower than on my Mega...until I rework the memory allocation to
>fast RAM, and then it generates a complete screen of graphics before the Mega
>starts (given simultaneous commands) to even update the screen.

Are all the same things running on both machines? You should run CACHE080
or so, FOLDR100 or so, and you should set the "fast load" bits of your
programs -- there is a TSR that does this for ST's, but starting with TOS
1.4 it's not necessary. This will all speed things up independent of which
kind of RAM the program loads into. If you have an ACSI hard disk then you
should NOT set the "load in TT RAM" bit of CACHE080.PRG, because if you do
accesses to the ACSI hard disk will be slightly slower.

>All is wonderful...until I try to print.
>Even from the Desktop, double-clicking on a text file, it says printing that
>file, delays proportionally to the length of the file, and quits.
>Printers are Epson GQ3500, Toshiba 341.
>Desktop printer configuration is to the parallel port. Any clues?

Are you sure it's configured for the parallel port? Are you running the
Control Panel and the Printer CPX? Try NOT running the Printer CPX. If
the delay is truly proportional to the length of the file then SOMETHING is
happening -- if you have no printer connected it should delay for 60sec and
then say "Your output device is not receiving data."

Parallel printers work fine here. The parallel port on the ST and TT is
the same, but there is a known problem with some printers: they have
pull-up resistors on the parallel port lines which are either too strong or
too wimpy (I forget which) and cause more current to flow than the Atari
parallel port can manage. The fact that your printer works on an ST argues
that there might be something else wrong; take your TT back to the dealer
and see if he can make it work, repair it, or replace it (it should still
be under warranty, right?).

>and apparently jiggling the power cord caused either a short
>or an open

Well, yes, jiggling ANY power cord which plugs into a device can cause it
to lose contact.

>...and it wouldn't turn on for several minutes after...

I can't explain this part of what you say -- there is no reason for it to
refuse to turn on for a while, then go ahead and turn on.

>Glenn Linderman glenn@sharebase.com 408-378-7575 x2366

I hope you'll get back to me on this stuff: I won't deny the possibilty of software or hardware quirks that result in the behavior you're seeing, but this is the first we've heard of them.

>so I tend to think that the problem is something on my end...though I have
>no idea what. Anybody have any thoughts, suggestions, or experiences with
>the same problem?

I am still reachable via email, just send stuff to
timg@landau.ph.utexas.edu after tomorrow (8/20/91). I would like to say
quickly here that I have fixed a couple of bugs in GS 2.2, but I haven't
had time to post the fixed code. The binary currently on atari.archive
will crash on multiple-page output (I worked around this-don't know the
cause), and the epson drivers don't work properly (this has been
fixed--finally I think).

Now for your problem .... Since similar questions are asked of me
regularly, I think this response is worth posting. Also, I would
like to receive comments from people who have encountered this
problem and have any ideas about its source.

My first guess is that you have your printer option switches set to skip
perforations at the beginning of each page. This adds a margin (.5
inches I think) to the top of the page and may cause the problem you
described.

If that doesn't work, your problem may be related to other reported
problems about DeskJet page placement (but these have always reported
placement too high on a page). Until recently, I thought that these
problems were due to using the DeskJet in A4 mode on 8.5 x 11 paper, but
it seems now that this is not the case. Since I don't have this problem,
I can't track it down, but here is a fix that has always worked.

1) Type 'gs -sDEVICE=deskjet' to get to the GS command line prompt, GS>

2) Type 'x y translate'
'factor factor scale'
'(file.ps) run'

GS will translate the picture in file.ps by x/72 inches to the
right, and y/72 inches up (x and y can be negative). It will
then scale both axes by factor, and then print the picture.
Play around until you find x, y, and factor so that the output
is where you want it. In your case, it sounds like a simple
'0 36 translate' may get it close.

3) After you find the right parameters, put these commands in their
own postscript file, say 'fix.ps'. Then you can type
'gs -sDEVICE=deskjet fix.ps file.ps', and file will print
in the proper position. If you don't want to type this
every time, you can modify the gs_init.ps file to run
fix.ps automatically at startup.

I've only seen Y-modem G as part of the Forem BBS's. I've used it without any
real problems to my ST. The main disadvantage with it is that the speed is
gained by doing NO error correction - if an error is detected then the
transfer is aborted. Personally I use Zmodem (using XYZ.TTP).

2096. HP Printers on my Atari

Newsgroup: comp.sys.atari.st
Date: 1991-08-20 01:07:20 UTC
From: system@n6vbg.hamavnet.com
Message-ID: <1991Aug19.180721.8@n6vbg.hamavnet.com>
Source record: 229454

Hello, fellow netters,

I recently acquired an HP IIIP and I would like to use it with my Atari 1040ST.

Do I need any special drivers? I am mainly interested in printing 1st Word documents, but I'd like to do some desktop publishing as well.

Thanks,

Javier Henderson
system@n6vbg.hamavnet.com

From: mforget@ersys.edmonton.ab.ca
Message-ID: <LDmy72w164w@ersys.edmonton.ab.ca>
Source record: 229578

Hello. I am trying to learn how to program in C, and to this end I am using Sozobon C. I am using version 1.1, and I have the GEMFAST.H, AESFAST.A, and VDIFAST.A files. When using Sozobon, though, it seems I can only make .TTP files. If anyone knows how to generate .PRG files, please let me know through email. Any help would be greatly appreciated.

2099. mcp and mfd (recently posted to binaries group) now free

Newsgroup: comp.sys.atari.st
Date: 1991-08-20 04:21:54 UTC
From: rcb@netcom.COM
Message-ID: <1991Aug20.042154.4866@netcom.COM>
Source record: 229575

'mcp', a flexible directory and file copy program, and 'mfd', a find duplicate files utility, are now free. These were recently posted to comp.binaries.atari.st as shareware. Now they are covered by the GNU copyleft, which means that source is included, and can be found on atari.archive under the 'fileutils' directory.

Enjoy ...

P.S. The new version of 'mcp' is especially worth getting, because it has significant enhancements compared with the original version, including support for the archive bit and more robust copying when errors such as target disk full or trying to overwrite a read-only file occur.

I have tried to reset the key bindings to emacs.key, but I can't get it to work. Can anyone spell out the parameters for keybind.ttp? Likewise, I can't get folder.ttp to list all the files om my hard drive.
I tried various command lines:
folder -a c: and folder -a -d150 and folder -a -d150 c: and so on.
I have TOS 1.0 - is that the problem?

This seems to be a fairly common problem (it must be because I experienced it too! 8^)

What I found to be the problem was that I was using the wrong transistor even though I looked up a near equivalent it just displayed diagonal black stripes with the (distorted) desktop pattern between.

The cure? just use the specified transistor (and keep the leads as short as possible).

Cheers, Trev..

This won't work with the standard 3.1 release on atari.archive, since there
is nothing called TEX.TTP. Instead, you have INITEX.TTP and VIRTEX.TTP. To
build the various formats, the commands would be:

for TeX:

initex 'plain \dump'

for LaTeX:

initex 'lplain \dump'

for SliTex:

initex 'splain \dump'

OR, if you don't have the necessary memory, I will look through my own archives
and find the copy of the format file mentioned (which I really did get from
the atari.archive server at one time!), and FTP it back so they'll be
available for everyone.

2103. Uniterm problems (revisited)

Newsgroup: comp.sys.atari.st
Date: 1991-08-20 11:00:01 UTC
From: 72347.2767@CompuServe.COM
Message-ID: <910820110001_72347.2767_EHA28-1@CompuServe.COM>
Source record: 229585

A few weeks ago I sent a series of messages about problems I was having with Simon Poole's Uniterm exiting with BUS errors whenever I was connected to a Vax using EVE or EDT in full-screen mode and I pressed the Return key.

I got numerous replies all basically saying it must be my imagination. Well, through a series of debugging routines and by wrapping Uniterm in a shell, I discovered that the culprit was the fast-load bit. When I got the program in its original package, the fast-load bit was set. Memory was not being cleared. There seems to be a routine in the code that references Malloced memory and assumes that any value other than zero means the memory contains a pointer to a valid address. The code is called only when the history buffer has zero bytes space and the SLE is off. Since turning off the fastload bit and turning on the SLE, the problem has vanished.

I just thought I'd send this note in case anyone using Uniterm has seen these errors and may have the fastload bit set in their version.

Like the respondents to my original message, I like Uniterm--I've seen nothing on the MS-DOS machines that approaches it for ease of use in programs such as ALL-IN-ONE.

Well, actually, since Frank Ridderbusch appears to have put up a newly compiled version of Tex 3.1, it WILL work this way. Dang. He's gone and merged INITEX and VIRTEX into one file. That just goes to show how quickly informational texts can be placed 'out of date' by updates in software.

The problem is, whenever a new version of TeX is released, the format files have to be regenerated in order for them to work correctly with the newly compiled code. So, you should follow the instructions in the 'readme_e.inf' file that Frank included in the TEXBIN.ZOO archive dated 14 August 1991 in order to figure out how to generate the new format files.

Of course, if you don't have the requisite memory, you're out of luck ...

Perhaps Frank (or someone with a lot of disk space and memory) can upload an archive of newly generated format files using the new binaries on the atari.archive server?

[I'm leaving for the World Science Fiction convention on Saturday, and will be away from my ST for the duration of my vacation, so it would be, like, mid-September before I could do it myself.]

Message-ID: <1991Aug20.113833.14241@abekrd.co.uk>
Source record: 229599

Hi guys,

Picked up a copy of ST User (UK mag - mostly games, but going back to ST World style Real Soon Now(tm)), today and in the news snippets at the front they said that Tos 2.0 would be made available for owners of old Sts on 512K roms.

They said that the roms would be available from September (I know don't ask _which_ September) and would cost around 50 pounds Sterling. Finally the mag said that this would be bad news for the likes of Gribnif and Double Click, because the new desktop did most everything the replacement desktops did _and_ speeded up disk access.

Anyone heard anything more?

2107. Supra Clock

Newsgroup: comp.sys.atari.st
Date: 1991-08-20 12:05:11 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1991Aug20.120511.5926@actrix.gen.nz>
Source record: 229587

Supra Clock Problems.

Well I have managed to get the Clock working in my Supra host adapter,
I did ring Supra to find out what IC they had changed to, but all they
would/could tell me was that it was a Dallas chip..

Well I had a look at the Data book of Dallas Clock chips and found
that it could be one of 2 clock ics, DS1285 or DS1287..

Note: The DS1287 has the Battery and Crystal inside, the DS1285 uses a
external Battery and Crystal oscillator.

Both are claimed to be replacments for the MC146818/CDP6818, that is fitted
to the Supra host adapter, but not so much as with the DS1285.

A help to the Net did not get any help at all, I wanted to find out the
Dallas chip No. that Supra was using in the newer Supra Drives/Host Adapters.

Well I contacted the NZ distributors for Dallas, and found that the only
one that they had in stock was the DC1287, at some $32NZ, would cost about
$12 in the USA..

Well I found out you can just remove the MC146818/CDP6818 and plug this
replacment ic, in.

Note: this Dallas clock ic, is a lot thicker than the original ic, but
this does not cause a problem.

Note: pin one is marked with a Dot, and faces away from the drive connector

The DS1287 has a 10 year battery life from the date of use, and with a
accuracy of +- 1 minute per month..

The DS1285 could be a cheaper option, but could not get the chip
that easy to test this theory.

> FORMAT31.LZH for the format files. This file does not appear to be at
> atari.archive. I tried using the stuff in TEXFMT.ARC, and it contained
> format files, but apparently they are not meant to work with version 3.1.

If you got an 2 Meg machine, try dumping the formats yourself:

You find the .TEX files in the archive INPUTS.LZH. For Plain TeX you'll need
PLAIN.TEX. Just type

tex 'plain \dump' -i

with TeX3.1 . '-i' tells TeX to run as InITeX and dump the
PLAIN.FMT-format-file.
For LaTeX, type

tex 'lplain. \dump' -i

and you'll get (tadah) LATEX.FMT

Copy both .FMT-files into your \TEX\FORMATS\ directory and start TeX with

tex &LATEX yourfile.tex
for LateX
or

tex &PLAIN yourfile.tex
for PlainTex

hope that helps you and all the other people who are grwoing grey hair when
installing TeX

2114. ST reset problem - HELP!

Newsgroup: comp.sys.atari.st
Date: 1991-08-20 14:14:04 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Aug20.141404.27593@magnus.acs.ohio-state.edu>
Source record: 229592
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently made several modifications to my Mega2+2 ST. It was working fine before this...

1) I got the ISAC card and found out that I needed TOS 1.4 (naturally I was not told this before ordering, seeing as TOS 1.2 is the standard chip set I thought it would work, how silly of me to think a product made for Megas would work in one...) Anyway, I installed TOS 1.4, but had to go from the 2 chip set to the 6 chip set since that was all the store had & I'm generally impatient. This includes removing one chip from the motherboard, installing one standard jumper, and moving two jumpers with (I believe) a capacitor on each. This went off without a hitch.

2) Next, I actually installed the ISAC board, It looks great! (in fairness, I should also say that I also had major monitor problems; The monitor I had supported the scan rates I was given for the ISAC board, but it still did not work, I had to get a new one, and also had to get an ST monochrome because there were so many software problems. Then, Monochrome mode on the ISAC kept coming up RED and WHITE instead of B&W, took me about 2 days to manage to fix that). However, I am very impressed with the board, it looks really nice, although it is a little slow in color mode.

3) The other modifications currently in my Mega are:
AdSeed
Overscan

NOW, THE PROBLEM:
The ST starts up and runs fine. Everything works as it should for about 1/2 hour. Then, I start getting more and more frequent crashes. The first sign is when I access a menu bar and the menu stays down & I get bombs. Then it will start to crash so often it is unusable until I shut it off and let it sit for about 1/2 hour and cool off. Then it works fine again. I am guessing that this is heat related since all the symptoms point to this. I did not have this problem with just AdSpeed & Overscan. I am thinking that possibly I got some bad ROM's. I've also heard of problems with some other chips in the Megas. I have eliminated the possibility of it being a software problem, I know it is hardware. If anyone knows:

1) What the problem may actually be (seeing as my diagnosis may be complete crap because I very well may not know what I'm talking about)

2) How to fix whatever this problem may be (any suggestions short of "throw your ST out the window down to the street several stories below and watch it get run over by large moving 4-wheeled-internal-combustion vehicles out of sheer frustration and general disgust", would be greatly appreciated).

3) Assuming that it is a heat problem, does anyone know of a replacement fan with a much higher "flow rate" that would fit in the same place? Anyone else out there ever installed another fan in some other location on their Mega?

Thanks for sitting through this way too long explination of a *hopefully* simple problem,

Message-ID: <1991Aug20.145100.22890@msuinfo.cl.msu.edu>
Source record: 229595

Is there anyone out using the PrintGraph program with VIP Professional?

When I use it, the graph comes out screwed up and it won't print
correctly. I think I might have an outdated version of printgraph.

Has anyone got this to work correctly...?

Hello NetWorld,
Excuse me if this... ...lately
BUT,

WHAT's the current status of UNIX for TT ?
During the spring term a rumour went around
that it was released in Germany in June ?! ...is it true,

If so, what's the price in Ger. and in U.S., and
where to get it ???

-> anybody from the A-house know anything ????

>>>

Uh, and some more fore the previous posting...

Where to get the new calamus SL, (in Ger/US/GB)...what's the latest version No.

Where to get PROFLIGHT in UK, and what's the latest version... (is there a
HAWK among the planes)?

WHAT`s the deal with the long spoken IBM-emulator for TT... like soft-pc for mac
It was to be released soon when I heard about it in the spring ???
is it ? ... ever ?

cmm1@cunixa.cc.columbia.edu (Christopher M Mauritz):
>
> This is absolutely true. Dave Small is probably responsible for more ST
> sales than any other single developer or group of developers. Most of the
> STs that are owned by friends of mine are used almost exclusively for Mac
> emulation and this was a major selling point when they bought the machine.

Now there's a thought. Who do *you* think should claim the title of
'Developer responsible for the sale of most STs'? No doubt the answer
will vary wildly according to where you live. In the UK, for instance,
most STs are 520s used to play games, so the title might go to Jez
(Starglider) San or the Bitmap Brothers (Xenon, Gods, etc.). Or would
it go to the creators of Dungeon Master, Populous or Lemmings?

In Germany, would it be the writer of Signum!, or Frank Ostrowski for
GfA Basic, or maybe the Calamus people, or who?

This one could run and run....

If you're loading small programs from floppy, baud rate hardly matters
at all. Up to a few KB, loading from a remote RAM disk is probably
FASTER than loading from a local floppy disk.

PLEASE get informed before you post. It'll make you look a lot less foolish.

Windows:

Click on the file manager if it isn't already running (ah the benefits of
multitasking). Open a directory window to the hard drive. Do the same for
the floppy drive. Drag the file from the floppy window to the hard drive
window. Just like GEM.

GEM: try to do the same while you're running a program.

2124. Generic shell for ttp?

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 02:59:54 UTC
From: jamesl@CIE.UOREGON.EDU
Message-ID: <9108210259.AA29316@cie.uoregon.edu>
Source record: 229457

A couple days ago I was looking around for a word count program, and found a program called "wc.ttp," which counts words and lines in an ASCII file just like the unix "wc." Anyway, when I use this program, it counts the words and such and flashes them onto the screen. Unfortunately, it goes back to desktop right afterwards, leaving me with less than 1/4 of a second to read them. Sorry, but I can't read that fast. There appears to be no provision for making it hold the info on screen like arc.ttp does, at least not that I can find. Obviously it's meant to be used with a shell program, like MT C-Shell, which I do not have and cannot afford.

Does anybody know of a small, simple shell program I could use with this thing? All it really needs to do is let me use wc.ttp and hold the results on the screen until I hit a key, so I have time to read them. I'd like to keep it simple, not get a whole big program to replace the desktop that I have to learn how to use. I suspect such a thing would not be that hard to program, but I do not know how.

Could somebody point me to such a program, say, on Terminator? I'd really appreciate it.

Thanks!

James Charles Lynn

From: rjast1@unix.cis.pitt.edu
Message-ID: <166698@unix.cis.pitt.edu>
Source record: 229461

Okay, so I've found out about Mystic Formatter, which essentially
was what I was looking for. But being the average ST user, I am
never satisfied (oh no!). So how about maybe as one of their programs
of the week make a NEW version, with a couple of changes. Instead of
being an ACC, make it a TSR. Why you ask? Well an ACC can only be
used if your program has access to the drop-down Accessory menu.
Therefore you can't use it from within say a TOS program (or any
program GEM or not that doesn't let you see the accessories).
Also, instead of a standard hot-key, allow the user to choose
his/her OWN hot-key combination (therefore allowing more compatibility
with programs that may use a similar key-press).
And finally, maybe include an option for those lucky souls who
have a 1.44meg drive (whoever modified their system to handle
these drives).

So what do you think? Sounds reasonable? (even coming from me :-)

Robert Anisko
rjast1@unix.cis.pitt.edu

Side note: reason I did not realize at first that Mystic Formatter
was a background formatter: the copy I got had NO DOCS, and when
I loaded it originally, it just looked like any other formatter,
so I paid no attention originally to it. Oh well, all those
wasted hours of foratting...

Well, I have 2.5 meg of ram, but that doesn't seem to be much of an issue.
When I un-archive the texfiles at atari.archive, I don't find INITEX.TTP nor
VIRTEX.TTP. I ftp'd /tex/tex31/texbin.lzh, and its main contents were
TEX.TTP and BIGTEX.TTP, among a few others. Perhaps there was confusion
during the directory restructure at atari.archive.

>finished. We're looking forward to meeting Atari on the Atari Fair in
>Dusseldorf and we'll have lots of things to discuss that should not be
>discussed in the public before.

Even if Atari Gmbh say "Hey that's neat. We'll take it" and Germany is flooded with lots of happy new TOS 2.x users that does not necessarily mean Atari US will welcome it. In fact I can see them saying that it is up to them to modify TOS not you and unless they do so I doubt they will support it. If you get Atari US on your side then it's in the bag.

>Maybe we can say more about all of this in a week.

Please do! I find the possibility of fitting TOS 2.x in my '86 ST exciting.
Non hardware orientated people though may be less enthusiastic.

2131. Re: Spectre 256k ROM support (was: System 7 and Spectre GCR)

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 09:59:15 UTC
From: kawakami@monsoon.Berkeley.EDU
Message-ID: <43036@ucbvax.BERKELEY.EDU>
Source record: 229464

If dsmall uses the NuTek ROMS it should be easier for him to support them than the current scheme. Why?

1. NuTek will be working to reconcile incompatibilities between their ROMS and the Apple System and Finder software. Currently, dsmall is doing this work by himself.

2. NuTek will be selling their ROMS to 3rd party clone makers, presumably to increase their market share thus forcing programmers to make their code compatible with NuTek ROMS. To sell the ROMS, NuTek must either strictly regulate the hardware they will plug into, ala PC clones, or document how to write drivers for varied hardware platforms. I tend to lean toward the second (though I know nothing about the NuTek design) because it would allow the development of plug in boards for IBM PCs that would give them Mac compatibility as well. (Imagine a 486 + 68030 running Unix with DesqView windows for Windows and Mac A/UX with sub windows for Mac applications. And another DesqView window for Tetris!)

3. In theory, a lot of the testing would fall into the hands of NuTek and dsmall would get to work on other projects. I'd like to see a true Super-Drive adapter which would give me a floppy that spit out disks and write them at 1.44 meg too. Considering that the 1.44 meg adapters cost so much a cheap alternative that would also write Mac disks would probably do OK.

"Dealer"?

"DEALER"?!?!

Oh, yes. Atari dealers. I remember those.

> Way to go, Matt; I'm sure "ripping your ST to bits" was just what a new
> Atari user needs to hear.

Well, it's pretty stupid to make the OS ROMs inaccessible without taking the machine to bits. If I designed a computer I'd have the OS on a ROM cartridge of some sort so you could open a section of the case, pull out the old cartridge and plug in the new one.

Didn't Atari do something like that with the 800?

mathew

2134. Blitter for Atari STFM

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 11:46:02 UTC
From: merwooa@crovm3.vnet.ibm.com
Message-ID: <9108211137.AA05262@grape.ecs.clarkson.edu>
Source record: 229466

Does anybody have any schematics or other information regarding the fitting of a blitter chip to an ATARI 520 STFM. I have one of the first blitter ROM machines with space on the mother board for the blitter chip. I bought a blitter chip from Best Electronics at a recent UK show along with a PLCC socket. Unfortunately I managed to mangle the socket and need to get another from somewhere in the UK. Is fitting the chip simply a matter of soldering the socket and plugging in the blitter or are there other things that must be done??

Any help would be appreciated.

Regards,

Adrian Merwood

> window. Just like GEM.
>
> GEM: try to do the same while you're running a program.

Agreed, you can't do this with just the plain ol' desktop loaded. but there are lots of desk accessories on the market which give you this capability (i.e. the ability to copy files easily while you're running some other program). Apart from the CLI .ACCs, there are programs like UIS III, Maxifile, even the ancient Crystal. Before anyone carps - I *know* this is not multitasking. It is, however, convenient, and I move files round all the time while using GEM programs.

Cheers,

Graham

2136. WordPlus, WP, WUP, speed

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 12:20:45 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <31619@know.pws.bull.com>
Source record: 229141

Clarence:

I received your E-mail note and I am replying to both the note and your net posting.

I have both WordPlus and WordPerfect (WP) on my TT. I have been using WordPlus for years and received 3.2 as soon as it was released. I have hardly used WP; I bought it to get around having to use Mass11 on our VAX network here (I intend to write in WP and run a convert utility).

While WP is much more capable than WordPlus, the latter serves my needs better because I have simple needs. When I want to do something complex, I run either Calamus or Pagestream and do real DTP work.

I had WordUP (WUP) for only a short time; I am an Atari dealer part time and I found that WUP crashed too much on my ST (had to remove all my accessories before I could get it to work the first time).

The problem that you will face is when you use a word processor that has multiple fonts that cannot be downloaded to your HP LJ; you'll have to wait forever for outputs. Your files will be bitmapped and sent down the parallel port at a snail's pace. The HP LJ handshakes more slowly than any laser I have ever seen or used!!!

At my day job I have an HP LJ with a Pacific Page postscript cartridge. Compared to my Atari SLM605 on my Mega 2 at home, the TT-HP LJ combination is a dog. Love my SLM605!!!; you should see it fly with Calamus.

So, if your want to run a graphics based word processor, use postscript (without the PS cartridge, the TT-HP LJ system is even worse) or get a real laser; the SLM605.

2137. OVERSCAN PROBLEMS

Newsgroup: comp.sys.atari.st

I just recently got a question about an Overscan problem addressed to me from "Thomas". However, I lost the file before I could reply. Thomas (and whoever else needs to know): I got the 60Hz version of the Overscan driver direct off of GEnie. The file name is simply "OVERSCAN.ARC". With Z-modem it only takes about 15 minutes I think...

Good luck,

```
I am looking for a C++ or/and smalltalk
compiler for Atari-1040-st
PD will be best but I would like to hear from any
moderately priced compilers.
Are there any C++ front ends that will generate
K & R C ?

Thank in advance for any info you can provide me with.

2140. Re: Minix?? Unix on ST??

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 19:22:11 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <16954@ccncsu.ColoState.EDU>
Source record: 229472

In refer to recent messages some said you need take the ST to bits in order to upgard the ROM. It's a little misleading. It's true you will have to open the ST up, I did my TOS 1.4 ROM upgard in less than 15 minutes and does not have any trouble with it. It certainly would be easier if the ROM access in a more open area but no need to scare people away from the upgrad.

2141. Re: Puting a pixel to screen

Newsgroup: comp.sys.atari.st
Date: 1991-08-21 21:15:00 UTC
From: Hayo_Schmidt@hh.maus.de
Message-ID: <A5757@hh.maus.de>
Source record: 229489

William Rosenkranz rosenkra @ convex.com made wanted to show a way, how to put a pixel by writing directly to the screen.

I can delete most of my reply, because K. Isakovic wrote why this is terrible. Just to support him, here is the rest of my message:

The method will not work on my Atari equipped with AutoSwitch OverScan!
It is even worse than using Line-A.
Why:
1) Physbase is not (always) the start of the screen bitmap.
2) The screen width is not (always) the width of the screen bitmap.
3) You never know how the screen bitmap is built physically.

Two conclusions:
1) Never write directly to the screen.
2) Never write mails like W. Rosenkranz's.

Unfortunately i could't answer Lahtinen's question either.
That's why this is the end of my flame.

Not quite: Karsten said the solution is v_marker,
v_pmarker is the correct spelling
(according to 2 DATA BECKER books, which is no proof that i am right, as everybody knows :-)).

And again:
Dave Halliday writes
>Why not use the standard VDI routine to draw a line of length 1 from your
>point to your point? Thus getting a dot?
DATA BECKER "GEM" says v_pline may not be used for putting a dot (which is no proof...)

>

The way you say "if you have a 2 meg machine" makes me think that maybe you can run TeX 3.1 on a 1 meg machine, if you get someone to give you the formats that he has dumped on a larger machine. Is this true? I know that it's true for the version of TeX 2.9 that I got from mail-server@cs.ruu.nl. The reason that I never upgraded to TeX 3.1 was because (a) I wasn't sure I could run it on my 1 meg ST, and (b) I didn't see anything wrong with TeX 2.9 (at least it wasn't bad enough to force me to upgrade).

So, please tell me: can I run TeX 3.1 on a 1 meg machine?

The magazine ST Applications is published by:

The St Club
49, Stoney Street
NOTTINGHAM
NG1 1LX
England
Tel: 0602 410241 (National)
+ 44 602410241 (International)

who will probably send you a free copy and subscription details if you ask nicely! They quote subscription rates for UK, Europe and the rest of the World.

The address is:

ST Applications
The ST Club
49 Stoney St.
Nottingham
NG1 1LX
UK

Tel: +44 602 410241

They do indeed accept subscriptions from the far end of the planet. I don't have a copy of the mag. with me at the moment, but I'm fairly sure that an airmail subscription for 12 issues and 6 disks of PD software to places outside Europe is 34.80 pounds. There are cheaper rates if you don't want the disks.

> >finished. We're looking forward to meeting Atari on the Atari Fair in
> >Dusseldorf and we'll have lots of things to discuss that should not be
> >discussed in the public before.

I guess it's possible that both are right.

What Ken means, I think, is that you can't just take TOS 2.0x ROMS, slot
them into an ST, and expect it to work.

What Laurenz means, I think, is that you can get a version of 2.0x to
work in an old ST, as long as you also put in various other
modifications. I don't know what these might be, or even how much has
to be changed in hardware. I'd bet you have to know the ST pretty well
to install the modifications, though.

And then there are all the legal and commercial questions....

There is the GNU C++ system available for the atari, but it requires at least 2meg of mem. The compiler is not a frontend, it produces real 68k code, and there is a link-compatible C-compiler. You can get both from atari.archive.umich.edu.
The smalltalk-system is also at a.a.,but as far as I know it does not have a graphical interface.

2155. Ataridr.sys for Supercharger needed

Newsgroup: comp.sys.atari.st
Date: 1991-08-22 18:11:43 UTC
From: ameij@vax.oxford.ac.uk
Message-ID: <1991Aug22.191144.1564@vax.oxford.ac.uk>
Source record: 229494

Dear Gang,

We have a Mega 4 here with a Supercharger. The DOS partition of the hard disk got made not-DOS-bootable-any-more by accident and our floppy disk drive destroyed the original Supercharger distribution disks, so we can't run the thing. We are having difficulty getting the people we bought it from to respond, so I wondered if some kind person would mind sending me a copy of ATARIDR.SYS which my PC loving (and partition wiping and floppy bashing, but let it pass...) office mate assures me is what we need, the rest being on the hard disk somewhere still.

I know this may be dodgy copyright-wise, but what the hell, you need a Supercharger to make any use of the program, and we're not keen enough to reverse engineer one from the adverts ....

Jan Ameij

I think that'll work. I've got the formats dumped (I have a 2Meg machine), my
TeX runs perfectly. Nevertheless I can't figure out how to upload s.th. to
atari.archive, because if I knew how to do that, I would have uploaded the
formats days ago.

So, please tell me: can I run TeX 3.1 on a 1 meg machine?
get your hands on the formats and try it out.
and please give a little report here...

>Laser C shell.

The only way to get around this (as far as I know) is to archive your files into a library so that the command line doesn't get that long. It's not really Gulam's fault, though. The command line length limit is imposed by the OS.

Gulam has its own problems, though, some of which make certain trivial operations impossibly difficult. I've wasted more time trying to get Gulam shell scripts to work than I care to think about. Examples:

1:

Gulam caches .g files when it sees them, but by filename, not pathname. This means that if you have two different foo.g files in two different places you'll horribly confuse Gulam. E.g.,:

```
cd dir1
foo.g
cd ..
cd dir2
foo.g
cd ..
```

will crash Gulam because it'll think that it's already read foo.g from dir1/foo.g when it gets to dir2/foo.g, and so it'll run dir1/foo.g twice (and get very befuddled in the process).

2:

Gulam's wildcard expansion is broken. If you have the line

```
foreach i { *.c }
echo foo
echo bar
endfor
```

in a script file and there are no files with the .c extension, Gulam will report "'*.c' failed," but will then echo foo and bar and report

"extraneous endfor". In other words, you can't use a wildcard in a foreach unless you know that some files matching the wildcard exist beforeheand. And there's no way to check that because you can't query a wildcard expansion for validity.

3:

The ... operator doesn't ever work at all, at least on my 2.5Meg ST with TOS 1.4. It just works for a while and then locks up the machine.

It's a shame that Gulam has these problems. At the moment I can't recommend it, even though it's an otherwise comfortable programming environment. It used to be my favorite, but after wasting 12+ hours trying to get various simple directory traversal operations to work I'm about to delete it (a couple times, for good measure, nyah-ha!).

If only it were still being supported, or if we had source... :-(

2159. Floppy Disk Warranties

Newsgroup: comp.sys.atari.st
Date: 1991-08-22 22:28:24 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Aug22.222824.11341@lsuc.on.ca>
Source record: 229487

This is going to be the last of my postings on this topic for a fairly long time. Essentially, I've run out of "bad floppies" to send back. :-)

As you may recall, I've sent back floppy disks to Fuji and BASF and reported their replies. In effect, both companies replaced their floppies as per their warranties and sent back "something extra" to re-imburse me for my time and expenses in making the warranty claims.

Now, since the earliest days of my Atari ST, I've used some Xidex and Precision disks. These disks were hard to keep track of because they were essentially unlabelled. However, they were serial numbered, and I kept track of the serial numbers. The first problem I had was tracking down the company. Xidex (who own the Precision trademark) was apparently bought up by Dysan who in turn was bought up by someone else. In the end, I sent them to Dysan in Canada. The reply was fairly prompt (faster than the other companies as far as I can remember). The note says "Please find enclosed a replacement box of Precision diskettes, honouring their warranty." Now, overall, there's not much to complain about in this respect, but I noted something I'm not happy about. These new Precision diskettes don't have serial numbers. In fact, they have no easy distinguishing features at all. There is no easy way to tell a new Precision diskette from any other "white box" diskette. So if one goes bad, how do I know it is a Precision this time in order to claim a warranty replacement? Yes, there's still a "Lifetime warranty to meet or exceed ANSI standards." It seems to me that Xidex doesn't want me to know it's a Precision disk, so I can't claim any replacements against their warranty. This is typical for "white box" diskettes, but it's not what I expect from Dysan.

With that minor sore point, overall, I'm fairly satisfied with their response, though not quite as happy as I was with BASF and Fuji.

Just wondering what the advantages of TOS 2.0x really are in
comparison to a regular 1040ST. And also, how do these features
compare to GEMINI 1.2 desktop? Gemini has alot of nice features,
and I couldn't see upgrading past my TOS 1.4 unless there was something
VERY special about it, like say multitasking (though I'm surviving
on MultiGEM at the moment...)

>It's not really Gulam's fault, though. The command line length limit
>is imposed by the OS.

Yes and no. Atari *has* published an official spec on how to put arguments into the environment, thus allowing more than 126 characters to be passed to a program. Gulam (more or less) supports this; just put "set env_style mw" in your gulam.g. (The Atari standard is very similar to the earlier Mark Williams ARGV standard, hence the "mw".)

Unfortunately, Laser C does not (or did not -- I haven't bothered getting upgrades recently) use the Atari recommended method. Instead, they invented their own method (arguments are placed in an environment variable called MMARGV). Hence, their own shell works fine with cc.ttp etc., but nobody else's does.

Gratutitous plug: if you're a programmer, *please* use a library that uses the official Atari sanctioned method of passing arguments in the environment. I hope the people supporting dLibs have fixed it to do this. Anyone needing sample code should grab either the standard gcc or the MiNT library; there's source code (in C) there for both argument parsing routines (for program startup) and also argument passing routines (for passing things to children; see spawn*.c).

> [list of some problems gulam deleted]

Personally, I find the redirection bugs the most annoying (programs starting with certain letters cannot be redirected; instead, the redirection (e.g. '>foo') is passed as an argument).

>If only it were still being supported, or if we had source... :-(

Yeah, a MiNT aware version of gulam would be really nifty. Sigh. Anyone feel like trying a port of tcsh? (bash is OK, but (a) it only works with MiNT, and more importantly (b) because of gulam I'm more comfortable with csh syntax).

Well I have no Problems with Midwinter, and TOS 1.4, may be you have a Faulty or Poor drive, or even a bad copy of the game..

Test the Disks with a Copy Program to see if there are no errors, a lot of games don't check for errors when loading.

Out of curiosity I tried this back with Spectre 2.65 or such. It did not work at that point. Of course there are new Soft PC products and new Spectre versions since then, so it might just work...

One of the local Mac stores has a "no-hassle-return-policy" (which only takes about 45 minutes of paperwork to complete), so I can pretty much try whatever I want and take back what does not work on the GCR. Needless to say this makes me much less nervous about buying new Mac products that may or may not work...

Good question Bob. I'd like to know, too. I DO know,
however, that Insignia Solutions' other product, i.e.
AccessPC, does work on Spectre. Access PC lets you read msdos
floppies in Mac mode (under Spectre 3.0). The only drawback
is that while it accesses msdos hard disks too, it cannot do
this under Spectre, since Spectre doesn't recognize scsi
connections. Thus, while a true Mac can read msdos syquest
cartridges, I cannot read them using Spectre due to the
limitation I just mentioned...I'll say it again: I wish this
could be corrected...somebody...anybody!

Funny that you should mention two problems with Gulam that I *haven't*
encountered and none that I *have* seen. Oh, well.

>3: The ... operator doesn't ever work at all, at least on my 2.5Meg ST
>with TOS 1.4. It just works for a while and then locks up the machine.

I believe this is not Gulam's fault, because "..." always works for me.
Hmmm... Do you run POOLFIX3? It is a program which fixes a bug in TOS 1.4
(and also 2.01 and 3.01), and that bug will EASILY be triggered by the
stuff that "..." does: lots of malloc'ing and lots of directory traversals.
Do you run FOLDR100? Do. TOS 1.4 drastically improves the situation with
respect to the 40-folder problem, but does not make it go away completely.

I have a bunch of stuff for sale. If interested call
(801) 484 2313 before Sunday afternoon (aug 25). After that day call
(508) 433 2108 (pepperell, MA). Ask for chad.

**************************************8

Atari ST, mono monitor, and 24 pin multi-font printer.
1 meg RAM, HD interface (home built), DSDD floppy, SM124 monochrome monitor
(super sharp). The printer is the NEC P2200.
The computer has an external industrial strength power supply (Boschert)
because the original wimp supply died.
Software inlcudes Atari Wordperfect word processor, personal Pascal 2.0
compiler,
microsoft (not sold by microsoft but by the same people) flight
simulator,
balance of power game by chris crawford, lots of public domain stuff
and a hard disk backup utility (commercial).
This is an excellent MIDI computer. Has not seen use in a year asI have
bought a Mac.

$550. With a 40 meg HD $750. (HD needs a case but hooks to the
same power supply as the computer -- the power supply could probably
run a lot of ataris and HD -- 25 amps at 5 volts, 5 amps at 12 or some such
rating, I was told it had a worth of $100 by itself, very stable and requires
almost no load).

---------

Vision V1.2 for the mac. Excellent pro-quality sequencer and very popular.
Can be upgraded to V1.3 for $29. I will transfer the studio name to you also
that it was registered under so that you will have full Opcode support.
Sam Ash wants $370 (at least they did a few months ago).
All for $200!

----------------

Steinberg SYNTHWORKS D50 for Atari ST. Excellent editor and librarian for
Roland D50 synth.

$25. If you buy the ST then $5.

-------------------

email chad@nutela.enet.dec.com or call before Aug 25 (801) 484 2313 and
ask for Chad

Hello Out there in Cyberspace...

I am currently looking into converting an ATARI ST into a Macinotsh. I already have a set of MAC ROMS (64K ROMS, 128K ROMS) that I would need to plug into the atari. My question is, where can I get the blank ROM cards that go into the side the ST, and also, is there anything else special involved? I have the MAC OS already, and I already have a monitor. So that's no problem. All replies are greatly appreciated...

Thank You for your time,

Salvatore Collora

Ymodem-G is actually a great program. Unfortunately, the only ST BBS program that I've seen it is Forem/Turbo. I know that all of the IBM boards I've seen support it. I wonder though, what the difference between Ymodem-G and ASCII are, really? Ymodem-G is more informative, and you can send Binary files using it. Well, I guess those are the differences. Are there any others, though? One problem with the program is that you can't send data using it. You can only receive. I used to use Zmodem for everything, but with my new modem it seems I can't. I have a Supra 2400+ with TOS 1.4 (aka "The Rainbow TOS") which claims to use RTS/CTS if you want. I guess it isn't really fixed, though, since I get 512 Byte blocks with Dterm and and strange messages from SZ and XYZ. Only when sending, though. Anyway, I've stopped caring about that for a while now, though. Does anyone know if there is a Ymodem-G UPLOAD utility around?

Yes, it is. If there is an error during the transfer, the program just aborts. No questions asked. Then again, if an error gets through a modem with V.42bis or MNP 5 then the line must be in REALLY bad shape. Using Ymodem-G without an error correcting modem is only safe on a crystal clear line that you never get line noise on. Even then it is a gamble since it only takes one character to mess you up...:)

I'd delete it too, except I know of nothing better. Any ideas? (Not limited to PD or Shareware...)

[Sorry, my newsreading software doesn't do quotes]
KBad speculates about TOS 2.x in 1040STEs and TOS >2.x in all STEs...

Yes, well what about my 1040STE with *SOLDERED-IN ROMS*? I'll have to go to the trouble of desoldering the ROMs and soldering in sockets, all because Atari was too cheap to spend the extra $0.50 for the sockets? I don't have a local Atari dealer, and probably wouldn't trust them to do the work anyway, so I have to remedy the problem myself. What about those users who can't do the work themselves, and don't have a local dealer? Talk about being left out in the cold...

It's totally backwards for Atari to go from socketing the ROMs and soldering the CPU (like in the 1040STF I used to own) to socketing the CPU and soldering the ROMs (like in my 1040STE, ordered direct from Atari Corp. in January). I'm sure a higher percentage of users will want to upgrade ROMs than their CPU! What competent person would have made this sort of decision? I know none of this is KBad's fault, but I'm hoping to make my feelings known. I'm an Atari Professional Developer, and Atari's not making machines upgradeable hurts not just *me*, but also indirectly hurts my business, since it means I'll have to program for older, buggier machines.

As an aside, since Atari has made different ROM sizes jumper modifiable in the STE (i.e. change a jumper to add larger ROMs), why would they possibly solder in the ROMs? This is inconsistent design.

>better to own a SUPPORTED workstation that runs a real unix and that
>you could do real development work on?

I think the idea is that you can do parallel processing research type development or just explore parallel systems. The ATW was mostly, as I understand it, intended to make use of parallel processing for the benefits that parallelism offers over powerful single RISC processors. Not just to become as powerful as similar RISC systems.
Obviously a SPARCstation and ATW are going to fulfill different needs and uses. Given a similar price, I would much rather have an ATW or any || system over a SPARCstation any day just for the fact that it is parallel and that interests me more. And hey, when you need more power, throw in four more T800s on a daughter board and you're set!

2179. Lock up at atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1991-08-23 22:07:08 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Aug23.220708.23881@terminator.cc.umich.edu>
Source record: 229256

For those of you experiencing lockup when you try to 'get' files from the archive,

1. Yes, I know the problem exists.

2. It's due to the funny statewide network we have here called merit. There's a part of it called UMnet that connects our campus together, and occaisonally, the part that controls the archive's host's interactions with the internet goes berserk. Certain character sequences trigger it. It should be fixed soon.

3. You're not alone. I can't read any mail if the subject begins with the characters 'IRC'. We just have to deal with it until it gets fixed.

>Only when sending, though.

Your Zmodem problem is probably easily fixed. Timeouts during uploads but not during downloads almost always indicate a disparity between what the modem thinks the flow control is set to and what the terminal program thinks the flow control is set to. Make sure your terminal program is not doing flow control of its own. Try setting flow control to OFF and see if your uploads work without hanging.

I had the same problem with my 9600 baud modem; getting the parameters right fixed the problem. I highly recommend the ports of sz and rz for the ST. I believe they were done by Bammi, but please correct me if I'm wrong. In any case, I've found them to be more robust that xyz.ttp and easier for batch transfers. Works like a charm!

This doesn't seem to have made it last time, so here goes again:

I read about a program in Z*Net called WINXV13.LZH that allows you
to get 127 windows on the screen simultaneously. Would anyone happen to
have this that they could upload it to the Terminator archive? Much thanks
in advance.

Does this affect BART as well? I've been trying for several days to
get a current index ... archive-server@twitterpater.eng.sun.com
doesn't seem to be working, either. No response. No bounced mail. No
nothing.

I'm trying to track down RDYE (STE version of the Mark Williams
RAMdisk) and an old-TOS GEM-autoboot program as favors for two
different people.

Source record: 229260

Oh, c'mon, that's been Atari's #1 problem since 1984.

NOT THINKING AHEAD.

There seems to be a problem in engineering and production.

I have no idea where their brains are sometimes.

The 1040 STe was released and mass produced while being full of bugs
(bad DMA, TOS problems).

The Mega STe has page flipping problems and supposely many other problems.

The TT/030 has problems with a monitor on top of it! There is supposely
drive access problems, etc. The 19" monitor won't even fit on top of the
TT/030, in fact- I doubt any monitors can be used on top of the TT!

The drive controller chip doesn't work with 1.44 disk drives.
Atari finally decided when the Mega STe and TT/030 was produced that it
may be a good idea to include a 1.44 drive with it.

I remember two years ago Atari asked the public if they wanted a 1.44 drive
with the TT/030! The public overwhelmingly said YES! A few months ago
Atari finds out they can't even include one.

The almighty Mega STe and TT/030 with a 720k drive.

I read close to 5 pages single spaced from a user on Usenet about bad
designs of the TT/030.

At this time last year, Atari was going to make a 16MHz TT!
Can you believe it? They changed over the speed of the microprocessor
but nothing else on it.

Atari lost a LARGE)INCREDIBLY(LARGE market in multi-media mainly since
not even the TT/030 can do even simple multitasking.

The engineers there should have thought of it.

The Mega STe should have had at least 1 higher resolution (with more colors).

There is little reason why Atari won't let users upgrade to the Mega STe
TOS- AT LEAST 1040 STe users.

I could go on and on and on...

The one thing I would really wish for Atari employees to do is when they
read this, they would let someone know at Atari our concerns.

Remember- if this keeps up, you might not be working at Atari! Not because you aren't good, it is because Atari might not be around.

And I have no idea how you could just not care.

You can always tell a good company by its customer suggestion box.
What customer suggestion box?

If the company has one, it is a good company.

Len

P.S.- maybe Atari might want to consider making their next computer-
Jaguar and ST compatible.

Atari Corp.'s official position is that NONE of their computer products before the TT030 is upgradable, in ANY way. They're all throwaway toys...

Atari reps here on UseNet have stated that these running changes in production are made for *Atari's benefit*... not for your benefit, not for mine, not for the users or developers, but for Atari Corp.. if they can get SIPPs for .05 cheaper than SIMMs, in they go...

Sure, sockets would cost less than a dollar, but that's a whole dollar out of their bottom line... forget it...

Well it can't be done, the Amiga uses a none standard type format,
they don't even use CRC to check there data, and even the index mark..

Y Modem G can only use with MNP4/5 V42 type modems, ie, error correcting ones, but Note: there is a CRC check on received data, and will drop out if it gets a error.

Note: you must use the TOS 1.4 fix2 to use RTS/CTS Flow control with TOS 1.4, the ONLY SZ/Zmodem upload that I found to work correctly, is the German Gem one.. GSZRZ18, I think, was posted to binaries some time back

This is the Brain dead attitude that Atari has got from where I wonder ?,
As you say to save a few cent, but to loose a 100 customers, have they
not learned anything as to why PC are so popular.

I hear that they are only fitting 2 Simm sockets to 520 STE's and 2 meg
Mega STE's and TT's.

I for one will only buy a STE, when it has TOS 2.XX fited and 1.4 meg
floppy drive, so wake up Atari or you will soon be losing anothere customer.

People buy Ataries because they are/were cheaper and because they don't have a lot of money to spend, but Ataries attitude that you have to Trade up, to upgrade, conflicts with the cost advantages of buying Atari in the First place.

To keep trading up, costs far more that it would if you could just keep upgrading your present computer.

Get with it Atari and try to think of what the customer whants and not what you dictate to them..

The first STE's came out with 32 pin 1 meg Eproms, they now fit a 28 pin
1 meg mask Rom, its all because of price..

EProms cost a lot more and have a higher rate of failure..

2193. "awk" for Atari St

Newsgroup: comp.sys.atari.st
Date: 1991-08-24 15:26:00 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <3085@tamsun.TAMU.EDU>
Source record: 229275

Does anyone know about an "awk" program that I could get formy Atari 1040st?
(Either professional or shareware or public domain)

I do have the PC/Speed product and IBM's PC DOS 3.3, but I would prefer
to run "awk" in TOS or GEM.

I even have Minix version, but I am so frustrated with trying to make it
work on my SupraDrive 20MB that I am abondoning Minix even if I can get
"awk" for it.

Oh, by the way, I asked for help on C functions for RS-232C paramters like
CD, DTR and such. I got lots of help. Only one person asked me to post
it, so I sent just him mail. If anyone ease wants about 2 pages of nifty
C functiosn to control a modem, send me a note. If enough people request
it, I'll be happy to post it.

Yes but if my figuring is right the to 2.x SHOULD be able to fit...
I realize the 6 chip sets get 192k by using 6 256k chips...
When you add all the bits together you get 1536 bits possible.. Then divide
that by 8 and you get the 192k that the roms take up...
However in the 2 chip sets which use 1meg chips...
You have 2048 available bits.. Which is the 256k I was told the other tos's
need.
However if the extra bits are addressable on them I havent looked.. ;-)

2195. Printing and Old Epson printers

Newsgroup: comp.sys.atari.st
Date: 1991-08-24 17:30:30 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91236.133030JJL101@psuvm.psu.edu>
Source record: 229276

I have an old FX-100 wide carriage Epson printer. What I was wondering
is if there are any PD or low cost word-processors out there that will let
me get a better print quality out of this machine than normal, since it
does not have NLQ mode (that I know of, no manual).
Why I ask, is that the quality of its printing from the Calamus demo
is FAR superior to anything I have seen it print. I would simply like to
be able to print text in a much 'better quality' way. I have tried First
Word, and STWriter, but cannot seem to get them to do better. I have used
the NLQ2PS (or similiar) file to make better text on an old Gemini printer

I used to have, however, this was a bother. So if anyone has any info on
how to get this old epson to print any better from any of the aforementioned
word processors, please let me know.

Thanks in advance,

david boyce (uunet!sifvs3.SINet.SLB.COM!boyce) and myself
recently did a port of g++ version 1.39.1. it should be available on
atari.archive. it works in conjunction with gcc-1.40 its libs and
utilities, and share everything it can with gcc-1.40. it does not
depend on UNIXMODE being available. (btw: the linker was fixed to
handle set vectors correctly, instead of using weird hacks to handle
constructors etc).

Gnu smalltalk v1.1 has been ported to the ST too. It does
not include any of the traditional graphic environment of SmallTalk.

The above should both be available on atari.archive.umich.edu

commercially: ParcPlace SmallTalk-80 (i have version 2.3, but
understand that later versions are available too) is also available
from Georg Heeg. This is the real thing.

All of the above need a decently configured ST, with 4M memory needed
for any serious work.

cheers,

My Atari monitor sits on top of my TT without any problems. Before you make the statement the NO monitor can sit on a TT, you should ask TT owners on the net. I know of two other TTs that work fine with the monitor on top.

Restt assured, it is. Here in Germany Microprose has said so in several ads,
the game magazines say so and my (very reliable) software dealer told me
I'll get it within four weeks from three days ago.

Hope this helps,

Techno

2201. Re: TT-UNIX

Newsgroup: comp.sys.atari.st
Date: 1991-08-25 12:28:14 UTC
From: covert@cactus.org
Message-ID: <9039@cactus.org>
Source record: 229284

Well this message will probably squirrel my deal with Atari but who
cares?

I offered my services as a beta tester for the UNIX on the TT (known
as ATX) back in June 1991. I even received a nice letter from a marketing
guy at Atari USA the first of July stating that I was accepted as an
ATX beta tester. since then I chatted with Bob Brodie a couple of times on
GEnie wrt ATX. But in the last six weeks I have heard NOTHING about my
status as a beta tester. And since I work full time and am trying to
do other things part time I don't have forever to wait for Atari USA
to get their act together.

So, what do I know about the ATX? Well, I was supposed to get a machine to beta
test it by August 1 (I foolishly thought it was 1991 but maybe they meant
1992 or 1993!). Which didn't happen.

I do know that the TT's native color rez isn't high enought to support
X Windows and so ATX was supposed to be deliver with the $1500 high rez
monochrome monitoer. Atari had an Interface builder called XFaceMaker which
would be included. but who knows? i just heard via the rumor mill that Tramiel
just fired the Atari Resident UNIX Guru, and if that happened don't hold
your breath for the ATX!

I hope someone at Atari will tell us what the He!! is going on with the
ATX!

Huh? What in the original poster's message makes you think that there is any piracy going on? Is it not possible that these are perfectly legal Apple ROMs (such as those used in Spectres)? And as far as finder goes, am I mistaken in believing that Apple allows it to be freely copied? Maybe I'm missing something here, but if not, you are reckless and should not be so quick to make accusations of felonius behaviour.

Regarding the origiginal poster's request for info about a "blank rom card:" Yes, there is a 128K block in the ST's address space which is mapped to the cartridge port, but plopping the Mac ROMs into it certainly isn't going to turn your ST into a Mac. Perhaps you are referring to Gadgets By Small's Spectre GCR which plugs into the ROM port and does turn an ST into a MAC. This is available for a few (couple?) hundred dollars.

This is Blatant Stupidity and you should be Removed From the Net..

What makes you think that he is copying anything??? He just said that he wanted an empty ROM cartridge for the ST to hold the (supposedly) legal ROMS that he already has. Granted, Apple does not like this, but they have no legal recourse since the only copyrighted material is the ROMS and the OS software, which he has legit versions of.

He might have a problem with his approach though. It took Dave Small of Gadgets by Small a few years to get the 64K ROM version of his package to work with any reasonable success. His new package that handles 128K ROMS really sparkles and can be had for around $250 (US). For that price, I'd skip the hacking...

Start Magazine + Program disks 1986-1989

My wife and I really want to get this out of the house, so we are
willing to sell it for any reasonable, semi-reasonable or probably
even an un-reasonable offer. So, name a price and it could be yours.

Before a big controversy brews again over this net, allow me
to put a little input into it (ensuring a controversy, eh? :-)
Onreading his message, I don't think he is attempting to pirate
at all. I think what he means by "blank ROM card" is the actual
SPECTRE cartridge,as he ALREADY has the MAC ROMS.

Of course, this is just from my reading of the message; and
obviously there are at least 2 readings of the message, so maybe
he should clarify himself.

Anyways, if his meaning is meant by my interpretation, then I'll
give him an answer. What he needs is a SPECTRE GCR cartridge
which is made by "Gadgets by Small." He can purchase one from
a number of mail-order places. He could then just take his
MAC ROMS, pop them into the cartridge, plug it in, load up the
included software, and away he goes...

I just jumped in because if he did not intend to pirate, then why scare away another user? Oh well, how do I get into these things anyways? :-)

2208. MultiGEM Question!

Newsgroup: comp.sys.atari.st
Date: 1991-08-26 05:30:41 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <uHu071w164w@ersys.edmonton.ab.ca>
Source record: 229373

Hello. A friend of mine recently bought a new ST, and he discovered a program called MultiGEM. It was installed on his Hard Drive, so he tried to use it. He had a little success, in that he was able to have InterLink execute in the background. He was also able to bring up a TTP program in a window. This was good, but he couldn't do anything serious with the program because there was no way (that he knew of) to exit from a background task other than clicking on an empty slot in the Desk menu. He asked me for help, but I've never seen or heard of MultiGEM. If anyone can tell me the following information, I will relay it to him:

1. Are there any keystrokes to exit a program while not in a menu bar?

2. What kinds of programs can be multitasked with MultiGEM?

The second question is for me, since I will consider purchasing the product if it is good. If you have any general information about the product, that would also be helpful. I hope someone can help him out (and me as well with the second question). Thanks for your time.

In <16601@skye.dcs.ed.ac.uk>, Al Crawford writes:
Hi Al,
>Anyone know of a utility that'll allow me to read bog-standard Amiga disks
>on a bog-standard DS Atari drive? I don't need the ability to write, or
>format or anything like that, just the ability to pull a file off an Amiga
>disk and spit it out as a TOS format file on an ST disk.
you won't be able to read normal Amiga disk in standard format. The Amiga
uses GCR coding, the FDC does not work with it. But there is solution:
Ask the Amiga guy to use crossdos (commercial) or dos2dos (pd, the name
might as well be dostodos). With this programms, the Amiga creates
standard IBM style disks that can easily be read by the ST...

2211. Atari fair in Duesseldorf

Newsgroup: comp.sys.atari.st
Date: 1991-08-26 11:02:15 UTC
From: univwa@sbuvax.rz.uni-sb.de
Message-ID: <12701@sbsvax.cs.uni-sb.de>
Source record: 229291

Hello everybody interested in Atari news:

This weekend, I visited the International Atari fair in Duesseldorf. Please
let me give you some of the highlights:

- I saw it!!!
Presented by the developer Mr. Hall/Atari USA:
The ST Pad !!!

- I saw it!!!
The ST Book !!!
(Wonderful thing!)

- I saw it, running!!!
The TT Unix !!!
(I had a talk with the software support man)

- I saw it, it was *also running*:
The Calamus SL !!!

- I saw it, presented by the developer Dave Small:
The SST Board !!!
(no negative criticism possible)

- I saw many interesting things more which I'm too lazy to describe...

I saw and met too:

Many people form foreign (Atari?) magazines, I read the company
names on their buttons, but I had never heard of. So wait for
the official publications to get more infos.

This was -IMHO- the *most* impressive, told in (very) short terms (as I
wanted to be the first to send you the good news).

But Atari couldn't forget their well known behaviour:

- no prices for ST Book and ST PAD

- no delivery dates for this and the TT Unix

(Mr. Hall was a bit astonished that I -after been given the ST Book's delivery
date = September- asked him: WHICH SEPTEMBER ? (I was not the last to ask in
this way I think. We all know Atari...)

greetings Bernhard

If you get Cross-Dos for the Amiga you can write DOS format disks in it, and then you will have no problem reading them in your ST! Note that I've never tried this myself, but it should work just fine...

Yup, I'm running both POOLFIX3 and FOLDR150. Perhaps it has to do with
the depth of my directory tree?

Really? Is the Spectre GCR/128 also then blatant piracy? How about PCDITTO? For that matter, what about all the PC clones? The NewTek roms? If someone buys the Mac roms and wants to play around making a Mac-emulator at home, then more power to them. As for having the Mac OS, what makes you think this person did not just go out and purchase System 6.0.x or 7.0? That's what you have to do with the Spectre GCR, and it is not piracy.

My TT also has serious interference problems when its VGA monitor
sits on top of it. No problems, though, with the 19" monitor standing
next to the machine, but with the PTC1426 I sometimes get alert boxes
when reading disks. They vanish as soon as I switch off the VGA monitor...
So this problem is REAL!

I forgot to mention in my original post of this message that my friend
bought the computer used, and that the program is version 1.01 according
to a program called MULTICON.PRG that was in the same folder. The
computer came with no documentation, which is something else I forgot to
mention.

2222. HELP! Need HP DeskJet Plus driver for 1st Word Plus

Newsgroup: comp.sys.atari.st
Date: 1991-08-26 19:40:50 UTC
From: wgg@hp-lsd.COS.HP.COM
Message-ID: <7460008@hp-lsd.COS.HP.COM>
Source record: 229364

I just upgraded my printer to a HP DeskJet Plus. My older version of
1st Word Plus doesn't supply a driver for this printer. I tried calling the
help number on my registration card, but it has been disconnected.

Does anyone have the driver, or knowledge of how I could obtain one??

Thanks,

Grant Grovenburg

Hello, Atarians!

Few things I would like to know:

First: I need a switcher to use two key-protected MIDI-applications
under MROS. Can you help me to find one which works well and is
relatively cheap. It can be for 2 or 3 cartridges.

Second: Can anyone tell me which graphic cards do work with Spectre.
I am looking for ones capable to 800x600 or 1024x768 pixels. Amount of
colors is not important, Spectre is 2 colors anyway...

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included. I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request. Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

If you want one of these, call or send a check to:

It is? Please explain.. I don't see anything that indicates piracy directly... having a set of Mac ROMs is legal, so is having a copy of the Mac OS if correct procedure is followed (IE you obtained it in a legal manner). I see nothing more than someone perhaps trying to reverse engineer Magic Sac which is impressive if successful...

>However in the 2 chip sets which use 1meg chips...
>You have 2048 available bits..
^^^^
Of course you mean kilobits.

>However if the extra bits are addressable on them I havent looked.. ;-)

The top 64k (bytes) is not addressable with the standard glue chip.
By applying a hardware patch to the GLUE it is possible to get an extra
32k of general purpose ROM space and also 32k of instruction-only ROM space
which would fully utilise the 256k available on the two 1-Mbit ROM chips.

It is simpler to retrofit the new TOS by patching GLUE so that the ROM sits at
the new base address. I wouldn't be surprised if this is the way it was done.

From: fendrich@salyko.doit.sub.org
Message-ID: <3667@salyko.doit.sub.org>
Source record: 229388

Hi,

after asking this question on GEnie and CIS in vain, it's my last
try to get some help from you out there:

I recently installed GNUEmacs 18.55 on my Mega-2.
All is running fine, except the probems with the serial port.

My main goal is the installation of an IRC-Client to call my university
from home with my ATARI.

The problem is, that my modem (2400 Baud) won't get any signals from
Emacs, neither with the enclosed Terminal-emulator, nor the server-file,
nor the telnet-file and nore the IRC-client.

I am sure that there occurs a problem in the config-file, but I don't
have any ideas.

Perhaps there's somebody out there to fix my problem ??!!??

Any hint would be appreciated !

Thanks,

Thomas

>legal Apple ROMs (such as those used in Spectres)? And as far as finder
>goes, am I mistaken in believing that Apple allows it to be freely
>copied? Maybe I'm missing something here, but if not, you are reckless

Apple claims full Copyright protection of their ROMs.

>and should not be so quick to make accusations of felonius behaviour.

The posting is not clear, and it's pretty clear that this is
because the guy who posted it doesn't really know what he's doing.
But I agree that it sounds to me that what he wants to do is perfectly
legal. He doesn't want to burn copies of the ROMs, he wants to stick
them in a ROM Cartridge under the mistaken assumption that this will
turn it into a Mac. As you point out, Spectre GCR (or the older
cartridge port adapters) are much more than just ROM cartridges
in the sense he seems to be thinking of them.

From: vovut@mist.CS.ORST.EDU
Message-ID: <1991Aug27.054604.24738@usenet>
Source record: 229356

I have some surplus ST hardware that I would like to get rid of:

* SM124 Monochrome monitor - $70
It's in good condition. I'm upgrading to a multisync.

* Video Key - $45
Connect ST to TV or VCR. Has RCA audio and video jacks.

* Magic Sac Plus - $25
For those that don't know, this emulates a Macintosh.
Comes with 64K ROMs and Epstart.

* Switch/Back - $20
I haven't used this much. It allows you to switch between
programs at the push of a button.

Prices do not include shipping.

If interested, please email to vovut@prism.cs.orst.edu

2235. Bombs with The Vault 3.00

Newsgroup: comp.sys.atari.st
Date: 1991-08-27 08:32:22 UTC
From: marc@uni-paderborn.de
Message-ID: <1991Aug27.083222.26474@uni-paderborn.de>
Source record: 229358

I've got trouble with Bob Fischer's new (3.00) edition of his "Vault".

The program looks a good deal nicer now indeed, but unfortunately I got the following error, which makes the whole tool worthless.

Using unformatted disks and two disk drives normally the box "I can't read this disk" (or something like that) comes up when accessing the next disk in the other drive, after completing the write to the disk in the first drive. I usually click "format" there and go ahead.

But two times (well, after the first time I removed _everything_ special from my setup, all acc's, all resident stuff, ending up with a factory-clean setup) I got _two_bombs_ instead of that box, and the program exited.

The problem occured first after the second or third disk, and the second time when accessing the 11th disk.

This is quite annoying. Did somebody else run into similar trouble? Is the author on the net? (Hiya, Bob!)

My configuration is, what I would say, rather normal: 520 ST+ with 2 MB, 30 MB harddisk, 2 floppies, monochrome monitor, TOS 1.4. As I said, I removed all potential obstacles from memory.

I didn't know this problem from the older Vault version, which was already quite nice. But I would like to use 3.00, if possible. If there is any fix or hint (aside from using pre-formatted disks, which I will try next), please let me know.

-Marc

I was there and I put my hands on an STbook. _Very_ neato design!

1MB RAM, 40 MB harddisk, 5 hours of operation with accu-set, cursor operated by 'vector pad': you put your finger on a mould and push into the desired direction. A bit strange, but ATARI said, after an hour you would be comfortable with it.

The STbook contains _no_ floppy drive, instead you can connect it to your PC (or ST, dunno) and use the STbook winnie as an additional disk (software needed, comes from ATARI). There is a reserved compartment for a modem to be added.

They expected it to be on the market in december. The price has not been disclosed (at least to me :-), but I heard them say 'like the stacy's price'. Let's see how ATARI will mess it up - oops, will sell it...

Some nice grafic cards could be seen, but I've got no $$$ to get a multisync monitor :-(

DC Software were there and I had the opportunity to talk to Mike Vederman (Hi Mike!). It's quite interesting to meet people you only knew from reading usenet-articles!

2239. ST RESET PROBLEM

Newsgroup: comp.sys.atari.st
Date: 1991-08-27 13:40:27 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Aug27.134027.19517@magnus.acs.ohio-state.edu>
Source record: 229362
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to thank everyone who responded to my last posting about my Megas random reset problems. I managed to add an -additional- internal fan (this was an extremely interesting task, if anyone is interested in how I did it, let me know and I will post the procedure). This did not help the reset problem, but it does send a lot more hot air out the back vent. (My stock fan blows out the rear, I understand some go the other way around, or maybe Atari just got confused and installed some backwards). It also seems to keep the reset/crash problem from occuring as soon, I can now stay on for nearly an hour before it starts to crash, even though I'm running the fan off the original internal power supply. I've ordered the heavy duty power supply from BEST electronics, and I'm sure I'll let everyone know if it does not do the job...

...As for my experiences with the ISAC board, it looks beautiful, and in really nice for DTP work, but there are many software problems, the most common of which is software checking for LOW resolution. The ISAC card in color mode (it also has monochrome) looks like a really huge low-rez screen to the software. So, software that should run just fine on this monitor will give the "will not run in low rez" alert, rats. This $599 card ended up costing me damn close to $1100!, I figured out that for that cost I could have sold off all my old equipment, purchased an old Amiga 1000 (which was as the local store) for $199, sent in the owners-manual cover, and gotten a really nice Amiga 3000 with AMAX and the ST emulators (I understand the *great-trade-up* in now over). Needless to say I'm a little bit upset. Oh well, I still like my old Mega (2+2), so I guess I'll keep it for a while longer...

2240. Re: games and TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1991-08-27 15:17:29 UTC
From: pwp@iuvax.cs.indiana.edu
Message-ID: <1991Aug27.101742.7738@news.cs.indiana.edu>
Source record: 229363

Thanks for the replies about MidWinter. Apparently it can be run on an ST520 with enough memory. Also TOS1.4 does not appear to be a problem. None-the-less I can not get the game to run. One person suggested a disk drive problem. The disk drive does appear to work fine, but I guess there are several possibilities along this line.

When trying to run MidWinter I unplug Magic Sac and the disk drive. I disconnect my one sided disk drive and have only the two sided drive plugged in. The two sided drive has the name MASTER-3S on it. Just to be sure I will try all this again tonight. I forget how the ST decides which dsik drive is A and B when two drives are hooked up, but the way I normally hook things up the two sided drive is drive B, but when it is hooked up by itself, it works fine as drive A. If any of this suggests things I should try, I will be greatful for your comments.

I agree with everything you say except for the bit about IBM software.
Allow third parties to built PC emulators, but don't drag the machine down
to the level of just another PC clone. Build something with a 68030 or
an 88000 in it.

> Developers that can say I WANT to build hardware and write software for it.

As far as I'm concerned, "I want to build hardware and write software for
it" if and only if "It is not based on any existing Intel processor".

My mistake. The bug is in TOS 1.4 and 1.06 and 1.62 but not in any TT TOS
or Mega STe TOS. The Sversion() value for the first fixed version is 0x1700,
which is to say Version 0.17.

In a program I'm working on, after a re-compile, the menu bar
decided that it wanted to stop appearing at the top of the screen
and is now showing up about three text lines down and half a dozen
spaces over from the left. I've tried everything I can think of,
including re-compiling all the source files and sorting everything I
can get at in the resource editor. Anybody ever have this happen
before? Any solutions?

The Supra 2400+ is a MNP 2-5 V.42/V.42bis modem. The program that I am
using is called HSFIX.PRG and is in german. The intro when it loads is
in english, and it says that it is for Tos 1.02 and higher. I haven't
been able to test it with sending yet, but I will soon. Has anyone ever
seen a Ymodem-G utility that SENDS? All the IBM term programs have that
protocol for sending and receiving, yet we don't. There are also some
other interesting protocols that would be interesting to see for the ST.
Jmodem (or is it Imodem) is supposed to allow you to send and receive a
file at the same time. That would be handy. So far the best protocols
for the ST seem to be Zmodem and Ymodem-G, though.

> Dave Baggett
> dmb@wam.umd.edu

I am using the newer ports of RZ and SZ by Roy Bixler. They have functioned flawlessly right up until I got my new modem. My terminal program is Interlink, or DTerm, and I have both set to use Flow control. DTerm isn't too specific about flow control (either it is on or off) but Interlink is set to RTS/CTS. I'll try your suggestion and see what happens, but then what do I do when I am online? A buffer overflow doesn't look pretty, and always changing the flow control might be a pain. I could have the modem use Xon/Xoff, perhaps?

Thanks for the information.

2252. GEMDOS and AES questions

Newsgroup: comp.sys.atari.st
Date: 1991-08-28 10:34:23 UTC
From: avgroeni@cs.ruu.nl
Message-ID: <1991Aug28.103423.290@cs.ruu.nl>
Source record: 229380

I'm writing a desk accessory(*) text editor. It's going to look very
nice, but I still have some (minor) questions which I'd like to
solve. The program will probably be shareware, but anyone who can
give a satisfactory reply to one of the following questions will
get free use and full update service!

(*) it can run as an application, too.

1. It seems to me that all OTHER text editors load files about
twice as fast as my program. I use one straight Fread(). Do
other programs use a special load procedure (and what about
GEMDOS Pexec()?) ?

2. Does the ATARI AES send ANY WM_NEWTOP messages? I never seem to
get one, while I'm in desperate need of them.
My desktop editor has a smooth (X-like) scroll bar, in
stead of the usual window attributes. So, the scroll bar and
the sizer box are really objects WITHIN the working area
of the window, and I have to take care MYSELF of hiding the
object trees of the slider and sizer when the window is not
active. I suppose, when someone else opens a window, or has
topped one, I should get a WM_NEWTOP message from SCRENMGR.
(My solution: use a timer event to do a wind_get(WF_TOP)
about four times a second.)

Thanks in advance for any hints,

From: ljtoth@athena.mit.edu
Message-ID: <1991Aug28.185954.3811@athena.mit.edu>
Source record: 229386

Are there any Atari hardware gurus out there with insight into the following problem?

I recently acquired an old Atari 1040ST, and attempted to use it to control a MIDI keyboard (Roland alpha-Juno 2). When making the final midi connection (to MIDI out on the keyboard) the computer's monitor (Atari monochrome) literally blew up! Power was on at the time to the Atari, which continued to merrily copy a disk throughout the incident, (yes, the manuals always warn you about plugging things in with the power on, I know,) but power was off to the keyboard. It really is beyond me what could have

caused the Atari to output a disastrous monitor signal, but not affect the computer in any other noticeable way.

My copy of T-Basic, (newest version bought from Dr. T. himself two weeks ago) will be for sale shortly, if the problem turns out to be something expensive. Please e-mail me if you're interested.

- Louis

2261. I still love my ST

Newsgroup: comp.sys.atari.st
Date: 1991-08-28 19:10:30 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <31629@know.pws.bull.com>
Source record: 229387

Very often, someone on the net discusses upgrading his/her system and toys with the idea of going to a Mac or a PC.

One local ST user, whose son is 14, wants to get his son a 'serious' machine now that he has 'outgrown' the ST. He said he was going to go to a PC because, as he stated, "its's a PC world out there".

First of all, kids in high school are going to use a micro for (i) programming, (ii) wordprocessing, (iii) spread sheets and then MAYBE (iv) database work, (v) drawing and CAD, (vi) DTP, and (vii) music. While the ST does not have software as sophisticated as the PC or MAC, for the level that high school students work, the ST can perform quite well for programming (C, PASCAL, MODULA), wordprocessing (WordPlus, WordPerfect, Signum,...) and spreadsheets (LDW). Database work can be done with dbMAN, although it lacks the ease of use of dBASE. The ST also has some great drawing and CAD packages and does extremely well at DTP and music applications.

My opinion is that the user's kid will use his new '386 super VGA system to (i) play games and (ii) run pirated software. PC users are the biggest pirates going. They steal WINDOWS, Word, EXCEL, Harvard Graphics, NORTON, etc from the work place and pass it around. Who do you know that has a PC with 'hot' copies of 123, dBASE, EXCEL,.....

I support the ST because I can afford programs like Pagestream, Calamus, Signum, WordPlus, LDW, Tiger, TigerCUB, EasyDraw, BeckerCAD. I have a Mega 2 with an SLM605 that blows away PCs connected to HP laserjets (even those with PostScript cartridges) and I did it at a fraction of the cost and with legitimate copies of software.

Sure, fast '386s and '486s are great in the business environment where all the software can be purchased. However, for home use, the PC user typically steals the software. I still love my ST because I don't feel like a crook!.

I seem to have half-solved my problem. By forcing the X,Y of the
GEM object to 0,0, the menu bar now appears in the right place --
but I still have no idea why it's coming in from the .RSC file with
goofy coordinates... Apparently, the resource is screwed up and
I'm afraid that this is just a small part of a larger problem that's
going to jump out later and eat me. Anybody know how to correct
this?
(Warwick: I tried to reply to your E-mail, but it bounced.
Thanks for your suggestion about the screen memory being offset, but
everything else (plines, dialogs) all draw correctly. The problem
appears to be in the resource file...)

2266. Is there a good logic circuit simulator out for the ST?

Newsgroup: comp.sys.atari.st
Date: 1991-08-28 22:08:19 UTC
From: s-hofmann@uiuc.edu
Message-ID: <1991Aug28.220819.6480@ux1.cso.uiuc.edu>
Source record: 229393

I'm looking for a good logic-circuit simulator (A circuit built of logic gates), for use in a class in elementary machine architecture and design. Is there anything (that will run on a 1-meg 520ST with monochrome moniter) that I can ftp? Thanks,

Scott

2267. 2.5 Meg upgrade

Newsgroup: comp.sys.atari.st
Date: 1991-08-29 00:09:00 UTC
From: Hayo_Schmidt@hh.maus.de
Message-ID: <A5873@hh.maus.de>
Source record: 229423

Christopher Russell yonder @ netcom.COM am Fr, 23.08.91 17:07 in ATARI.ENG #A28931@SUB was yelling:
CR>Anyways, I understand about CAS and RAS and all that, I just don't
CR>understand which setup is excecptable: 512,2M or 2M,512 or maybe both
CR>or OK.. Somebody PLEASE help..... thanks...

I just built in an upgrade of 2MB last weekend. My doc says, that an upgrade to 2.5 MB won't work with the MMU by the manufacturer IMP.
If you have the letters IMP on your MMU, you must deselect the 512 KB and take the 2 MB as bank 0.
Otherwise both setups should be ok. My setup is 2M, 2M using a bank 0 of 2 MB and for bank 1 the two old 512KB banks, connected with a GAL-chip. That makes 3 MB. The system thinks, the RAM over 3MB is defective and ignores it.

2268. TeX -- uhhg!

Newsgroup: comp.sys.atari.st
Date: 1991-08-29 00:18:17 UTC
From: yonder@netcom.COM
Message-ID: <1991Aug29.001817.22800@netcom.COM>
Source record: 229398

Well, I spent several days upgrading my ST to 2.5M so I could run some more software.. Especially would like to get TeX running. Well, after several days, I've managed to create *.dvi files, but I haven't got any of the dvi2* programs working. Basically because I am hoping that I can get the fonts directory setup with 99e99 hours of work!! I have got the dvifnts1.zoo and dvifnts2.zoo files from atari.archive, which have the directories already setup. Unfortuantely, it doesn't seem to want to build the directories correctly. In the readme file, it says to do zoo -x// dvifnt?.zoo. Hmm.. -x isn't valid for zoo! And what are those slashes all about? What version of zoo is this?

What dvi screen viewer is the best? It looks like maybe the 3.3 viewer is.. I don't quite understand what all the "server" stuff is about though -- maybe somebody could fill in a neophyte TeX user.

I would be a very happy guy if somebody would send me a ls -lR of there TeX setup! And explain to me how to build the fonts directories from those zoo archives! ...thanks in advance...

-x isn't valid for zoo when it gets folded to uppercase! This is what the Atari .TTP dialog will do. You can get around this by running from a CLI, or by using a third-party desktop replacement, which isn't so neanderthal.

Cheers,

By using a Eunuchs-hosted arc:

+ ARC - Archive utility, Version 5.21, created on 04/22/87 at 15:05:21
+ Usage: arc {amufdxerplvtc}[biswnoq][g<password>] <archive> [<filename> . . .]
+ Where: a = add files to archive
+ m = move files to archive
+ u = update files in archive
+ f = freshen files in archive
+ d = delete files from archive
+ x,e = extract files from archive
+ r = run files from archive
+ p = copy files from archive to standard output
+ l = list files in archive
+ v = verbose listing of files in archive
+ t = test archive integrity
+ c = convert entry to new packing method
+ b = retain backup copy of archive
+ i = suppress image mode (translate EOL)
+ s = suppress compression (store only)
+ w = suppress warning messages
+ n = suppress notes and comments
+ o = overwrite existing files when extracting
+ q = squash instead of crunching
+ g = Encrypt/decrypt archive entry
+
+ Adapted from MSDOS by Howard Chu

Email me if you can't find the Eunuchs sources.

Sorry, wrong answer. "-x//" is also not valid when not folded to uppercase.
Use "x//" instead.

ZOO commands beginning with a hyphen are ``novice'' commands
like -list, -extract, and so forth. The x// argument should work
fine if you simply omit the hyphen. If it doesn't, try ZOO -restore.

Basically 'x' means extract and '//' means with full pathnames, creating
directories if necessary.

Note that ZOO is case sensitive, so you can't run it from pre-TOS 1.4
Desktop. If you run it from a command shell, be sure the shell doesn't
muck around with the slashes (you may have to quote the arguments).

ZOOSHELL will make this a lot easier, I promise.

Message-ID: <1991Aug29.143906.16334@cm.cf.ac.uk>
Source record: 229408

Hi,

I've got a program that runs fine on a STFM.

However, I've got an STE. The program works fine except for one problem.
The mouse does not work. once the program is fired up the pointer is stuck on
the screen. you can move the mouse using the cursor control keys from the
keyboard. Doing this all utilities seem fine but are laborious to use since
this method of mouse control is very slow.

Is this is common problem and if so is there a cure or patch available?

Glad to hear the good news!

Though, a couple of questions...

Was their any word on the price of the upgrade board for the ROMs?

How come I have a funny feeling that it will cost more than its worth.

And will the upgrade board for the TOS only or will it allow you to
get STereo sound, hardware scrolling, more colors, and a blitter?

Too bad someone couldn't think of an affordable way to get all of these
things added to the STs...

2285. ATARI ST <---> IBM PC disk format

Newsgroup: comp.sys.atari.st
Date: 1991-08-29 18:30:39 UTC
From: defrain@ei.ecn.purdue.edu
Message-ID: <1991Aug29.183039.10852@noose.ecn.purdue.edu>
Source record: 229418

greetings,

I am interested in writing to a 720K floppy from an IBM PC
and reading the data on the Atari DSDD drive (also 720K).
I have had as much (or little) success as being able to
read the directory of a disk formatted on the IBM, written
to by the IBM and read by the Atari but this doesn`t accomplish
much.

Is there a utility available for the IBM via FTP to allow
it to read/write files for an ST? Is there a method to insure
compatibility between the IBM and ST? I have tried the
720K DSDD format on the IBM with 9 sectors/track -- this is what
gave the directory of files on the ST written to the disk by the
IBM. As it is, I have no other method to transfer files to the ST
thus a utility for the ST is no good because I can`t run it on the
ST (not being able to put anything on a disk in ST format).

anybody have any suggestions? This is all very frustrating...

thanks,

pdd

[Stuff deleted]

I had a question about MNP5 and V.42bis. These are just two different data compression algortithms that are implemented in some modem's hardware, right? If so, would it be possible to write a file-transfer program that implements these algorithms so that non-MNP5/V.42bis modems can transfer at the same rate (if they have the same base bps of course - you can't expect a 2400 bps modem to transfer at the same rate as a 9600MNP5/V.42bis, but you can hope to get the same through-put as a 2400MNP5/V.42bis). This means that the program would have to be run on both ends (encode/decode), but is it workable, not to mention possible.

2288. Supercharger Problems

Newsgroup: comp.sys.atari.st
Date: 1991-08-29 19:27:30 UTC
From: chanp@ccu.umanitoba.ca
Message-ID: <1991Aug29.192730.1718@ccu.umanitoba.ca>
Source record: 229421

A friend of mine recently purchased the Supercharger IBM emulator and has been having nothing but problems with it.

From time to time, the thing just stalls, even when at the DOS prompt with no other programs running. Each time you press one of the cursor keys, it seems to repeat a gazillion times (the red data exchange light stays on solid for half a second to a full second). The DOS shell doesn't work well because of the cursor keys problem and if you try using the mouse it usually stalls after a minute or two of use.

He contacted Rio Computers who wrote the software and told them his troubles. The software he was running was v1.3 and Rio suggested getting v1.5 and that would correct his problems. Well, he got v1.5 but none of the problems went away.

His system consists of an STe and a printer.

Anybody have any solutions to this mess? Or, does the Supercharger normally work this poorly? Rio Computers was little help in solving this with answers like "Really, it should work." or "Beat's me why it doesn't".

>files round all the time while using GEM programs.
>

Actually, this IS multitasking. Cooperative mustitasking. ACCs are compiled
separately and linked separately from other programs. In fact, this is the
thing I found so disappointing about GEM. It seems to have "the stuff" to
handle multiple cooperating processes, but it's crippled to allow only one
program and six little "applets" which have only limited access to the OS.

Another thing I found frustrating is that VDI sees the screen as one big
device instead of having each window be its own device. In other words, the
graphics engine doesn't know about the window system. The result is that
if you want to draw a line in a window, you have to query the window manager
for the visible portions of the window and then clip your line to each visible
rectangle. What a mess. Also, VDI is severely lacking as a graphics engine.

The best evironment I've ever seen is still OS/2. It has way too many
calls, but it's EXTREMELY powerful, especially the graphics subsystem (Gpi).
When OS/2 2.0 comes out, we can forget about the segmented 16-bit Intel
architecture forever.

I did, but...

----- Transcript of session follows -----
550 oxygen.siesoft.co.uk!arshad... Host unknown

... so, here's the answer in public:

Of course ... that's what they were written for.

But they're outdated. I can uuencode and mail Gemfast 1.6 if you
would like.

There also will be a new (unofficial) release of Sozobon C, possibly
next week. Ian Lepore, author of GEMFAST, has fixed some Sozobon
bugs, improved the optimizer, greatly speeded up the assembler, and
made the whole package Desktop-friendly. Sozobon C 1.31i was released
a few weeks ago with some problems; 1.32i is being tested right now
(and looks good).

2292. stuck mouse wrong e-mail address

Newsgroup: comp.sys.atari.st
Date: 1991-08-30 07:48:20 UTC
From: dave@cm.cf.ac.uk
Message-ID: <1991Aug30.074820.6198@cm.cf.ac.uk>
Source record: 229427

Hi, I posted this yesterday but somehow got the wrong email address in the header. It was one of my coleagues. the correct address is now in the header. Please respond again (if you did yesterday) if it's not to much trouble.

I've got a program that runs fine on a STFM.

However, I've got an STE. The program works fine except for one problem. The mouse does not work. once the program is fired up the pointer is stuck on the screen. you can move the mouse using the cursor control keys from the keyboard. Doing this all utilities seem fine but are laborious to use since this method of mouse control is very slow.

Is this is common problem and if so is there a cure or patch available?

Thanks in advance

Dave.

>Allow third parties to built PC emulators, but don't drag the machine down
>to the level of just another PC clone. Build something with a 68030 or
>an 88000 in it.

I'm sure Len was not suggesting that Atari make a Super-Clone of the PC variety. What I see is that Atari builds something which can run all the PC software but is not a DOS machine. I would go further in saying that Atari ought to make a machine/OS combo which can run all Unix software without requiring a constant ongoing effort with porting it. This ought definitely not be just another Unix machine. Let's see some brand new hardware with a brand new OS that shows some real innovation. TOS, GEM and 8086-DOSBIOS emulation would be included by Atari, with a PC bus available as an optional extra, MacOS and AmigaDos etc. would be available from 3rd party developers - All of these supplied only as compatibility options.

Yes, I hate Intel processors too. However, sometimes I have no choice and have to run software which was written for a DOS machine. It is important to me, that I can run whatever software I like on a machine which I don't have to be ashamed of. I would rather run DOS software on a decent piece of equipment than on a DOS doorstop which can do nothing else. The latest Intel-based machines are IMHO expensive junk on a dead-alley leading nowhere.

Look back (business world) after another 10 years, there'll be plenty of surprises.

2294. GEM programmers at DRI

Newsgroup: comp.sys.atari.st
Date: 1991-08-30 09:03:14 UTC
From: jan@janhh.hanse.de
Message-ID: <2123.08.91@janhh.hanse.de>
Source record: 229445
Cross-posted to: alt.folklore.computers,comp.sys.atari.st

Just out of curiosity I made up a list of programmers who were involved
in the creation of GEM and GEM applications at DRI. The dates given
mark the first/last time I found their name in a copyright notice etc.

Maybe somebody is interested or can add a name/date.

Happy trails,
Jan

--- here goes the list ---

Balma, Philipp
Bancroft, Susan G. 9.4.85 - 26.4.88
Borders, David 9.4.85 - 29.9.86
Bourne, Jim 17.9.85

2296. Where Okami English Docs?

Newsgroup: comp.sys.atari.st
Date: 1991-08-30 11:35:47 UTC
From: iadt3tb@prism.gatech.EDU
Message-ID: <35668@hydra.gatech.EDU>
Source record: 229209

I want to use the Okami shell for a while. I can't figure out from guessing at the German documentation and the English help file how to establish an alias. The format that I use on the unix boxes at work doesn't seem to work.
Therefore: 1. Did the English documentation for Okami ever get created? If so, where can I find it; I've missed it if this got mentioned on the network.
2. Can I set up an alias in the Okami shell? If so, how?

Thanks,
Terry Banks

2298. TT Unix / TT TOS

Newsgroup: comp.sys.atari.st
Date: 1991-08-30 13:03:17 UTC
From: adamd@rhi.hi.is
Message-ID: <3541@krafla.rhi.hi.is>
Source record: 229431

I was wondering...

Is it possible yet in TT unix to set up a virtual ST machine.
Wouldn't this be something for Atari to support?
I really don't like the idea of the TT being either TOS or Unix but not
both together.

Someone in the know, please enlighten us.

2302. RAM disks for Mega4/ste???

Newsgroup: comp.sys.atari.st
Date: 1991-08-30 19:19:19 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <GAUDREAU.91Aug30151919@juggler.East.Sun.COM>
Source record: 229434

Are there any RAM disks that *work* on a Mega4/Ste? I've tried a
couple, and they lock the machine up quite nicely!

I remember something about the Mark Williams version being fixed to
run properly but can't find the reference.

Pointers to atari.archive would be welcome.

Thanx.

Joe

> Oh, c'mon, that's been Atari's #1 problem since 1984.
By your lights.
>
> The 1040 STe was released and mass produced while being full of bugs
> (bad DMA, TOS problems).
FULL of bugs? Au contraire. Full of bug fixes, maybe. No software is EVER
completely bug-free. Ask Apple.

> The Mega STe has page flipping problems and supposely many other problems.
Are you hypothesizing, or do you know of them for a fact?

> The TT/030 has problems with a monitor on top of it! There is supposely
> drive access problems, etc. The 19" monitor won't even fit on top of the
> TT/030, in fact- I doubt any monitors can be used on top of the TT!
Buzz. Wrong answer. I ran mine for two days straight w/ a 14" Seiko, no
problem. I would say it depends on the individual machines. Parts that
are only marginally within spec sound like the problem.

> The drive controller chip doesn't work with 1.44 disk drives.
True. Atari (a la Bob The Brodie) says they have the new drive chip done,
and is going to the ogre (FCC) for approval now. :-)

> I remember two years ago Atari asked the public if they wanted a 1.44 drive
> with the TT/030! The public overwhelmingly said YES! A few months ago
> Atari finds out they can't even include one.
Vague, vague, vague. "...the public..." Who? They didn't ask me. Did
they really need to ask? Doubtful.
"A few months ago..." few = ?? They can easily throw the drive in, the
controller chip that they can't get from Western Digital is the difficulty.

> The almighty Mega STe and TT/030 with a 720k drive.
800k, thank you. And a hard drive. And an Appletalk port. and and and

> I read close to 5 pages single spaced from a user on Usenet about bad
> designs of the TT/030.
Mail it to me. I'm curious what others perceive to be wrong.

> At this time last year, Atari was going to make a 16MHz TT!
> Can you believe it? They changed the speed of the microprocessor
> but nothing else on it.
Major redesigns take major time.

> Atari lost an LARGE)INCREDIBLY(LARGE market in multi-media mainly since
> not even the TT/030 can do even simple multitasking.
Buzz. Wrong answer. It does simple, cooperative multi-tasking. Run any
accessories lately? Windows 3.0 does simple?, cooperative multi-tasking.
System 7.0 does simple?, cooperative multi-tasking.

Amiga.* does pre-emptive multi-tasking. Is that what you want?

> The engineers there should have thought of it.
They have, and are, according to the the employees on the net.

> The Mega STe should have had at least 1 higher resolution (with more colors).
Opinion.

> I could go on and on and on...
Please...don't.
> The one thing I would really wish for Atari employees to do is when they
> read this, they would let someone know at Atari our concerns.
Someone at Atari? Aren't they "someone at Atari?"

> Remember- if this keeps up, you might not be working at Atari! Not because
> you aren't good, it is because Atari might not be around.
Life goes on.

> And I have no idea how you could just not care.
Maybe they do, maybe they don't. Know for a fact they don't?
>
> You can always tell a good company by its customer suggestion box.
> What customer suggestion box?
Buzz. Wrong answer. A good company has better communication then a customer
suggestion box stuffed on some inaccessible wall somewhere.

BLeh. Ack. Oop.
Bob The Schulze :-)
Darn happy with my TT, wish more games worked.

From: gt3449b@prism.gatech.EDU
Message-ID: <35715@hydra.gatech.EDU>
Source record: 229210

I am trying to find out something for a friend of mine...
Please also note that I know very little about the Atari machines
technically speaking.

My friend has a 520 ST and would like to beable to run some software
that is capable of seni-complex text and graphic designs. He is a
an evangelist at the church where I go and makes overheads and other
types of hand outs for classes. Presently he has the opportunity to
buy a used copy of Calamus. This appears to do what he will need it
to do, BUT he says it will only work on a machine with 1MB of memory.
He has also mentioned something about needing a double sided floppy
drive and from what he has said the 1040 ST has that built in.

My questions are:

1. Can he find a software package at a reasonable price that can do what
Calamus can do and work on his present 520 ST and hard drive?

2. If not, is it better to upgrade memory in his 520 ST and buy an
external DS floppy OR find a used 1040 ST?

3. If upgrading his present machine is a good option, where can he
find a DS floppy at a good price and where do we find specific
information on how to upgrade his memory(I know it's a piece of pie
on a IBM PC, but I know nothing about doing that to a 520 ST).

Thank You for any information or advice...feel free to suggest something
I might have over looked!

Michael Peters

I add:

Well, Poolfix3 and Claus Brod's version won't install on my TOS 1.62
machine, and it prints a message that the machine doesn't need the
fix. Just remember, such free info is worth what you paid for it 8-).

2307. dbMAN V v 5.2 w/compiler

Newsgroup: comp.sys.atari.st
Date: 1991-08-31 00:38:50 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1991Aug31.003850.23846@uokmax.ecn.uoknor.edu>
Source record: 229437

I'm wondering just how compatible this program is with dbXL.

If I use a subset of commands that are common to dBASE III+, IV, and dbXL then just how likely are programs developed for these programs likely to work with dbMAN? Vice versa?

Anybody know if 5.2 is the latest version of dbMAN?

How buggy is dbMAN?

Oh yeah, what about databases created in one system or the other? Will I be able to convert them between dbMAN and dbXL formats or are they the same?

Is a hard drive required? I have two DS/DD drives and 2 Megs of RAM on a color system. Is this sufficient?

I'm looking for a better price than $168 (US dollars, of course). Any one know of a mail order place that could beat this (Name and #, please)?

adTHANKSvance,
Kenneth Love

2308. drawing lines with uniterm vt100 emulation

> program would have to be run on both ends (encode/decode), but is it workable
> not to mention possible.

Yes, what you are suggesting is possible and has been done. The program
was released some time last year, and I think it was called TURBO2 or
something close to that. It used a common compression routine to
compress data as it was being sent and to uncompress it on the other end.
It had one drawback, though. It wouldn't work with REAL modems with the
compression. You had to have two stock, plain, modems to use it. A
modem with the special hardware compression would not work with a modem
with the software compression (it wouldn't do any compression, I mean).
I never used the program, since none of the boards I called used it. It
was an interesting idea, though. Hardware compression is better though,
since it tends to give you better compression (faster, too).

2311. How do I disable Control-C?

Newsgroup: comp.sys.atari.st
Date: 1991-08-31 08:38:46 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <BJcJ81w164w@ersys.edmonton.ab.ca>
Source record: 229442

Hello. I have been learning the C programming language for about four weeks now, using C Primer Plus. I wanted to learn because I could make faster, more efficient code with C. Unfortunately, one problem is still dogging me.

In all of my programs that use text output functions, pressing control-C during an output causes the entire program to terminate. THIS IS ANNOYING! How do I prevent this from happening? The functions I use are:

```
getchar()
putc(character, file)
getc(file)
```

These are the only three I used for input and output.

I don't think you can use Xon/Xoff flow control, with Program File transfers,
only with Text...

The version I looked at implemented an error-checking algorithm, but not
compression. There are such programs for the PC, though, and I know of no
reason why realtime compression couldn't be done on the ST.

But I'm not wholly sold on the idea. You don't win if you're transmitting
data that's already compressed (ARC, ZOO, LZH) and introducing layers of
protocol into the data stream can make interactive use sort of -- well --
``lumpy.''

2315. WANTED: Circuit Maker or Circuit Maker II

Newsgroup: comp.sys.atari.st
Date: 1991-08-31 19:27:20 UTC
From: s-hofmann@uiuc.edu
Message-ID: <1991Aug31.192720.21420@ux1.cso.uiuc.edu>
Source record: 229447

Can someone please point me to a used copy of Circuit Maker? I've just called every dealer in the US whose number I had, and none had the programs. I'm at the point where I'll take almost anything, as long as it can simulate a logic circuit comprised of AND, OR, NOT, NAND, NOR, or XOR gates. A program using 7400-series TTL chips would also work quite nicely. Can some kind soul please help this student in distress? Thanks,

Scott

>to get the same through-put as a 2400MNP5/V.42bis).

This can be done, yes. Instead of the dedicated modem hardware/firmware you
would be using CPU cycles on the main processor of your computer (ST).
There is a disadvantage with this approach if you want to multitask with other
programs. On a plain vanilla ST there might not be enough cycle bandwidth
to keep up with the transfer at full speed and do whatever else you are doing
at an acceptable speed.

So, where is such a program available for the ST / TT ?
Are there any legal complications involved? (patented compression methods etc.)

>the program would have to be run on both ends (encode/decode)

The other end could have a full-feature modem instead.

From: cordes@ac.dal.ca
Message-ID: <1991Aug31.212056.1185@ac.dal.ca>
Source record: 229303

I'm using Braner's Zmodem (version 1.6) and while it's pretty much bullet proof, it does have one annoying "feature". I often automate downloading but RZ.TTP insists on pausing at the end of the batch with a "press any key to continue" message. Can this be disabled?

2319. Neodesk/Assempro Incompatibility

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 00:30:16 UTC
From: cordes@ac.dal.ca
Message-ID: <1991Aug31.213016.1186@ac.dal.ca>
Source record: 229304

Has anyone experienced problems using Assempro with Neodesk 3.xx? I've found that the debugger locks up if Neoload has been run. Under Neodesk 2.xx it was the Shellfix program which caused problems. Now that Shellfix has been incorporated into Neoload, I'm stuck with a Debugger that won't.

2320. POSTING FLOPPY DISCS IN MAIL (CUSTOMS SCANNING DAMAGE)

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 01:32:43 UTC
From: t821431@minyos.xx.rmit.oz.au
Message-ID: <1991Sep1.013243.19870@minyos.xx.rmit.oz.au>
Source record: 229331

Has anyone experience damaged floppy discs after they have gone though
overseas airmail?

Do the customs or postal services scan all mail with damaging magnetic fields
in search of the things they are meant to find?

I have just experienced a disc which worked no problems but i sent it to a freind in the
USA and he says the disc is damaged!
I had checked the disk on another atari before sending it and i have never had
alignment problems on my machine.

Does anyone know anything about posting floppy disks(did i just have bad luck?)

Thanks in advance

Richard Clarkson

I noticed that I could never get the "x" feature of zoo working. I tried about 57 suggestions. It end up that PCOMMAND was ruining the paramter list. When I used the restore facility everything worked fine.

2324. Nifty RS-232C functions

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 03:59:58 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <3159@tamsun.TAMU.EDU>
Source record: 229307

Ok, here are those nifty little RS-232C functions. Over 15 people wanted these, that why I posted them here. Please press "n" and skip over this source code if you are not interested in it.

Please realize that I have modified these somewhat for my own purposes. I have tried to keep up good documentation. Also, I did not write everything here, so please keep the name of the original functions in tact. I freely give away any functions that I "Mark Lehmann" have offered as long as you don't copyright the function and not let me use what I wrote.

```
#include ".\\headlist.h"

/*********************************************************************
function: dtr
author: Steve Yelvington
purpose: raises or drops the RS-232 Data Terminal Ready (DTR)
signal
usage: dtr(int control)

where control is an integer having value 0 or 1.
control values mean:

0 drop dtr
1 raise dtr
*********************************************************************/

static dtr(on)
int on;
{
if(on)
Offgibit(0xEF); /* DTR on */
else
Ongibit(0x10); /* DTR off */
}

/*********************************************************************
function: rs232cd
author: Steve Yelvington
purpose: checks for RS-232 carrier detect signal
return:
values: 0 for no Carrier Detect
1 for Carried Detect
*********************************************************************/

int rs232cd() /* state of rs232 carrier detect line */
{
```

```
register long ssp;
register int *mfp, status;

mfp = ((int *) 0xFFFFFA00L); /* base address of MFP */
ssp = Super(0L); /* enter supervisor mode */
status = *mfp; /* get MFP status */
Super(ssp); /* return to user mode */
return(!(status & 0x0002)); /* check for carrier */
}

/*****************************************************************
function: mprintf(char *fmt, ...)
author: Mark Lehmann
purpose: writes output to both the console or to the serial
device. Only writes to the serial device if a carrier
detect signal is on.

usage: this command replaces the printf command and therefore
requires you to use the "sprintf" command before calling
mprintf.
*****************************************************************/

int mprintf(string)
char *string;
{
extern rs232cd();
int i;

for(i=0; i<=strlen(string); i++) /* print string from */
{ /* char 1 to end */
Cconout(string[i]); /* display to console */
if (rs232cd()) /* if there is a carrier */
{ /* detect then */
while(!Cauxos()) /* send data to RS-232 */
; /* device if it is ready */
Cauxout(string[i]);
}
}
}

/*****************************************************************
function: mgetchar()
author: Mark Lehmann
purpose: gets a character from the RS-232 port or from the
keyboard
*****************************************************************/

int mgetchar()
{
int cbuf; /* character buffer */

extern rs232cd();
```

```
cbuf = -1; /* initialize cbuf to a value */
/* that cannot be an ASCII code */

while (cbuf==-1) /* while cbuf is not set */
{

if (rs232cd()) /* check for carrier detect */
{
if (Cauxis) /* if ready for input from RS-232 port */
cbuf=(Cauxin()); /* get cbuf from RS-232 port */
return(cbuf);
}
if (Cconis()) /* if input exists at the console */
{
cbuf=(Cnecin());
return(cbuf);
}
}

/*********************************************************************
function: clear_input_buf
author: Mark Lehmann
purpose: Clears any characters that might be in the input buffer.
The input buffer can be the information stored in the
keyboard buffer or in the RS-232 port buffer.

This function is good when you want to start a program after
the modem is already in a carrier detect mode.
*********************************************************************/

void clear_input_buf()
{
int temp; /* the bit-bucket */

while(Cconis()) /* while the keyboard buffer holds a char */
temp=Cnecin(); /* put the char in the bit-bucket */

if (rs232cd()) /* if there is a carrier detect then */
while (Cauxis()) /* while the RS-232 buffer holds a char */
temp=Cauxin(); /* put the char in the bit-bucket */
}
```

It seems that most UNIX developers add a IBM emulator product that allows
UNIX users to access DOS on their UNIX machine. No one does a good job
at it. I guess the best DOC emulation that I have seen is in IBM's AIX
operating system on a PS/2. DOS running under AIX on an 80386 or 80486
machine seem to work somewhat satisfactorily but not good. It is just to
hard to make a full emulator under UNIX and get everything you want in
that emulator. PLEASE don't not expect to be happy even if Atari does
an outstanding job in a product offering TOS and UNIX at the same time.

2326. Mini Closet Cleaning...

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 04:20:00 UTC
From: coteb@woods.ulowell.edu
Message-ID: <1991Aug31.232000.1@woods.ulowell.edu>
Source record: 229450

I have some stuff here in my closet that I am sick of looking at so I am trying to get rid of it here:

1. SC1224 color monitor. I sold the CPU to someone who needed it to start up a BBS but he didn't want the monitor. I am asking $140 + shipping

2. I don't know what happened to these disks but I have the manual for WordUp.(Old manual + supplement to 3.0). I am asking $5 for shipping.

3. I have a 5.25" IBM type drive that I sort of put together. I think there is a loose wire because sometimes the computer wouldn't recognize the drive. It is in a double case. I think someone with a litte electical know-how should be able to get this thing going. Unfortuately, I don't have the disk anymore that changed the step rate of the drive. This type of program shouldn't be too hard to find though. Asking $35 + shipping.

4. Finally, under my bed I found the disk for Music Studio by Activision. I don't know if the disk is still good but the first mail response I get with an address I'll drop it in the mail for ya.
Please reply by mail if interested. Thank you.

2327. NeoDesk 3.0 and Command Line interpretter.

If you're specifically attached to ksh, the Korn Shell, you probably
should contact David Parsons <akcs.orc@vpnet.chi.il.us> and ask him
about TSH. If you like csh, there are a couple of versions including
the (commercial) Beckemeyer C Shell, which also comes in a
multitasking version. I think the Gemini folks are working on an
improved Mupfel that will be more csh-like.

Credit where due: I think I got those functions from Dale Schumacher, who gave us all dLibs, got me on the right foot about pointer arithmetic, and made me believe I could write C code despite significant evidence to the contrary.

2330. English Docs For Turbo Assembler

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 12:39:23 UTC
From: cordes@ac.dal.ca
Message-ID: <1991Sep1.093923.1188@ac.dal.ca>
Source record: 229310

A while ago someone posted the Internet for Markus Fritz, author of Turbo Assembler. I had hoped to contact him regarding release of English docs and .RSC file but the mail bounced. I believe the address I had was Markus_Fritz@hh2.maus.de. Can someone check if this is accurate or update with his new Internet address? I'm sure I am not alone. Turbo Assembler looks like an excellent package.

From what I know there is a Program to do MNP5 but I don't think I
have seen one for V.42, but note , Hardware can run a lot faster than
software, and that could be the main reason..

2333. Is the Megaroids source offer still good?

Newsgroup: comp.sys.atari.st
Date: 1991-09-01 14:06:51 UTC
From: chu@acsu.buffalo.edu
Message-ID: <1991Sep1.140651.25389@acsu.buffalo.edu>
Source record: 229313

Hi,

Can anyone tell me if Megamax (if that's what the company is still called) is still selling the source to Megaroids??

I got the game long ago. I misplaced on one of my disks and now I've finally found just exactly where I've kept it all these years! (:-))

Anyways, looking at the game now, I really want to look at the source and hopefully pick up some techniques for motion and collision detection.

Please reply by E-mail. Thanks!

Message-ID: <1991Sep1.173941.18144@mailer.cc.fsu.edu>
Source record: 229318

I received some ST software sight unseen from a buddy of mine. Mostly garbage but with one interesting program. It is called "Little Computer People", from Activision 1985/1986 on the original disk. It is a simulation of a house with a little guy and dog (intended for children). I find it moderately humorous (you can run him around by ringing the telephone and alarm clock, have him play games with you, play songs on his organ, play records on his stereo, etc). I did not receive any documention with the disk whatsoever. I have figured out lots of stuff through experimentation, but would like to get the full docs. Does anyone have a copy they wish to sell? Anyone seen it in a bargin bin somewhere? I wish to purchase a complete copy, with docs.

Hey, don't snicker! I may have a brat or two one day and they might like it (ok, so it's really me who wants to play with it).

2337. Added a drive to a 1040ST

Newsgroup: comp.sys.atari.st
Date: 1991-09-02 02:40:53 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91244.224053JJL101@psuvm.psu.edu>
Source record: 229319

I just added an external drive to a 1040 st, and it seems no matter which
disk it is accessing, a, or b, the external drive will spin (noisily) as long
as the a drive is spinning. The a drive however, does not spin while accessing
the b drive. Is this a common problem? Just curious... the only problem
I have with this is the external drive is 3 times as loud as the internal one
and would prefer it not to spin unless it had to.

2341. Railroad Tycoon: MONEY

Newsgroup: comp.sys.atari.st
Date: 1991-09-02 08:40:06 UTC
From: nanchen@uni2a.unige.ch
Message-ID: <1991Sep2.104006.1040@uni2a.unige.ch>
Source record: 229323
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.games,comp.sys.mac.games

Hello friends,

I dunno if this helps, I hope it will. Sorry if everybody already knows this or if this special feature does only work on my IBM PS/2.

Yes, I have no mac, amiga or atari, so sorry for polluting these newsgroups.

For having quite much money on Railroad Tycoon, try to take control of another railroad company at just more than 50% of its capital. Then, transfer as much money as possible to your company and sell shares up to exactly 50%. At this point, the owner will probably try to get a 500'000$ bond. When this is done, but again 10'000 shares and tranfer money to your company. Repeat up to the point when you see the company cannot afford more bonds. Then wait. Two things can happen:
1) the company is dissolved (no good for us)
2) it stays, but profit and cash is red and quite high.
If point (2) occurs, on my PS/2 anyway this sometimes happen, I only have to wait until the red cash amount gets up to about 25'000'000$ and then it gets back to positive (black) amount. You'll see when it does change, because the company starts again paying back bonds. But don't let them pay back their bonds; instead, take control of it. You now only have to tranfer money (about 26 million dollars) to your company and be president of the United States.

I hope this helps and that it's well explained. If not, send me a mail and I'll try to get it clearer. But in short:

1) Take control of a company

2) Let them get as many bonds as they can

3) when profit is red and cash also, sell shares. Only keep 50%.

4) Wait some years, until cash is black again

5) When you see the company pays back their bonds, take again control of it.

6) Tranfer the 26 million to your company and start the whole thing again...

Cordially.

>What is the easiest way to send output from gnu ghostscript2.2 to
>an atari SLM804 laser printer?

A while ago (two month ?!) I posted a deskjet/epson printer file
previewer (called "showgs") to comp.binaries.atari.st. It was
written for ghostscript 2.1 which lacked a screen driver.
One of the nice features of "showgs" was the option to spool
the image to the SLM 804 (<S> key).

>Can anyone use the included driver on an epson 9 pin? It *almost*
>works, but sends many (unwanted) line feeds during the print.

In ghostscript 2.2 the generated printer codes for the epson
driver have been changed giving lots of people problems. The
changes will be undone in the next release of ghostscript.

>

i did this with zmdm (my port of chuck forsbergs x/y/z modem protos to
the ST) it now does compression on the fly. what i found was that it
was hardly worth it. the thruput on large files went from around an
average of 918 cps to around an average of about 924 cps @9600 baud
over a hardwired link (so there were no modems involved). i suspect
this is more a phenomenon of the compression scheme used rather
than the concept.

cheers,

Source record: 229325

We were attending the Atari Messe show in Germany and were unable to upload our POWs for the last three weeks of August. I have just done so to terminator and the binaries newsgroup.

The programs are:

DC Mouse-ometer will let you know how far your mouse has travelled during your hard-at-work or just-having-sessions on the computer. Suggested by a friend of a "Mac user with this neat little mouse gadget."

DC Run Rez automagically switches screen resolution for files that don't do so on their own.

Just say no to "Please switch to ???? resolution" alerts!

DC Light Off will turn off your floppy disk drive (and light) after you have booted up. Useful when you boot up without a floppy disk inserted in the drive. Suggested by Larry Novak.

All programs 100% assembly, ST, STe and TT compatible. Program of the week.

Thank you all for your help. There was even one that didn't
contain nonsense. The correct answers, though, were posted by
Ken Badertscher of ATARI:

One straight Fread() is the fastest way to load a file
(except maybe a first-read-FAT, then
read the tracks from the center to the
edge of the disk- but what IS the center
and what IS the edge? I always write CLEAN software)

The AES does NOT send WM_NEWTOP messages. (anyone who does
not care about porting to an IBM can leave the
WM_NEWTOP case out, and save about 8 bytes)

Ken is the only one that deserves the promised free copies and updates.

> Have someone tried this program?

I tried it. It has serious problems with large dialogs -- they move around well enough, but images of the mouse pointer are left splattered all over the screen. Charles F. Johnson (Codehead Software) said LetEmFly appeared to break a number of programming rules and recommended against using it. There is a similar program from Gribnif Software, but I haven't tried it; perhaps someone could post a comparison.

I am trying to find out something for a friend of mine...

Please also note that I know very little about the Atari machines

technically speaking.

My friend has a 520 ST and would like to beable to run some software

that is capable of seni-complex text and graphic designs. He is a

an evangelist at the church where I go and makes overheads and other

types of hand outs for classes. Presently he has the opportunity to

buy a used copy of Calamus. This appears to do what he will need it

to do, BUT he says it will only work on a machine with 1MB of memory.

He has also mentioned something about needing a double sided floppy

drive and from what he has said the 1040 ST has that built in.

My questions are:

1. Can he find a software package at a reasonable price that can do what

Calamus can do and work on his present 520 ST and hard drive?

2. If not, is it better to upgrade memory in his 520 ST and buy an

external DS floppy OR find a used 1040 ST?

3. If upgrading his present machine is a good option, where can he

find a DS floppy at a good price and where do we find specific

information on how to upgrade his memory(I know it's a piece of pie

on a IBM PC, but I know nothing about doing that to a 520 ST).

Thank You for any information or advice...feel free to suggest something

I might have over looked!

Michael Peters

I'm sure zoo says to use 'zoo x//', not 'zoo -x//'.
As far as I remember, zoo thinks of this as a
commands rather than an option.

However, the problem of options folded to upper case
may also hit you.

Have fun.

I am using the Atari ST version of ghostscript. The monochrome
viewing of the files come out just fine... but when I try to send to an
Epson FX-100 (I know, old printer, but would like to use this to 'preview'
the output in print). The docs say there may be some problems with the epson
9 pin driver. But the pr.ttp program takes the gs_pr file and starts sending
it. The output looks like it is 'almnost correct' in that the graphics are
noticable, but... it outputs forfeeds quite often (as in every 2nd line or so).
Perehaps some dip switches need to be switched? I do not have the manual for
the epson printer, so I am not sure which switches control what. If anyone
out there has any info that may be of help it would be greatly appreciated.

Hi, Can someone please please help me with cadaver ?
On the second level...
Found 3 of the coins which you use as tokens for the mouth in the wall
where is the 4th ?
Is there anything behind the drape with the fire holes early in the 2nd level ?
Is there anything I can do with the rising and falling stones ?
I have been to the floating room and all down that way, the green bottles etc
and the chains and pits.
The door in the room with the recharging chests I can't open.
I sleeped an eye (usually where the tortoise comes out) does he have anything of value ?

Thanks in advance
Ralph

A question for all you DTP'rs out there, I have Timework DTP and
have messed around with it. Now that I have graduated I have more time
and would like to get a more advanced program.
I see that Calamus is still out there and have noted that Pagestream
has recently released a new version. Both of these products are in the
same general price catagory, although I know that Calamus is suppose to
release a new version soon.
I guess what I want to know is Calamus still the most bang for the
buck or does the new Pagestream give it a run for its money?? I'm not going
into this to be a professional DTP'r but if things go well I could always
stand to have more professional features.

Thanx in advance

I've been using it for weeks with a 4 Meg STe without a single
problem. Even with dialogs covering 90% of the screen, I've had no problems
whatsoever. I like it better than FormDoIt because of the flying dialogs and
CPX configuration program.

Buy Mr. Small's GCR if you want to do anything serious with your ST....

OR well, like all things in life there are exceptions to the rule...

Buy Turbo C...gosh, AWESOME. I get aroused just booting the program.

Not really, you could try getc, which is very fast and part of the C
stdlib.

You can also try altering your BUFSIZ in your stdio.h file to improve
read performance as well.

And of course you can always try an asm subroutine.

But it is true, as Ken said, the speed could also be related to the
overhead in maintaining your data structure which holds the text in itself.

Let me know how it goes.

You can't. Of course I have never tried to do something like that so I qualify that with I never had a need to.

But, if you don't like those routines, use the BIOS Bconin/Bconout commands and make replacement routines which do the same thing.

write me if you need an example.

2368. ST memory allocation

Newsgroup: comp.sys.atari.st
Date: 1991-09-03 03:30:27 UTC
From: wwhy@vax5.cit.cornell.edu
Message-ID: <1991Sep2.233027.7135@vax5.cit.cornell.edu>
Source record: 229348

Hello,
I am having problems with the memory allocation on the ST. The BIOS
function getmpb doens't seem to work at all. It always returns a pointer
to the same mpb no matter how much memory I have allocated. I was wondering
if anyone knew how to find out what blocks are allocated and free.

The reason why I need this information is because I need to write my own
malloc and free functions. I have to write my own functions because I
need to use malloc and free inside an interrupt (this would normally make the
ST crash).

I have seen a program on terminator in the programming directory (memaddrs.arc
- or something like that) that prints a list of allocated and free memory.
I tried to disassemble it but it was written and C and it is difficult to
follow.

So, if anyone can help me out, I would appreciate it greatly.

Thanks
Bill

Letemfly now has version 1.11, that works even better than the 1.00
(surprise). With the old version I only had 1 program, that didn't run
under a special environment. The new version should fix all the problems you
had, except that one with the splattered screen. As I know, that could
have it's origin in a defective blitter. Some of my friends who work
with large monitors have similar problems, that always could have been fixed
disabling the blitter.

> be polled by other people.

Correct me if I'm wrong, Michael, but this combination is not a BBS. It's capable only of providing you with personal access to the network. You can forward mail and Usenet messages to other sites if they're willing (and able) to run UUCP-compatible software, but Joe Average can't call your computer using Flash or Uniterm and read Usenet news over the phone line. I think that's what the original poster asked for.

So far as I know, the only currently available ST BBS that allows Usenet messages and UUCP/Internet email to be incorporated into the message base is STadel, a variant of Citadel. There are some bugs in STadel's Usenet interface that may be corrected when Fortress (an upgraded STadel) is ported to the ST. The port reportedly is in progress.

David Parsons' Bauble project is aimed at producing a new Usenet-capable BBS, but so far as I know, it's not yet finished. Bauble UUCP sources were posted in comp.sources.atari.st earlier this year.

> how can i extract files, without going on little atari-st ?

Best is by looking at UNIX-archive-sites. There is the source code for
arc 5.12 available. It's the same package as source foor arc 5.12 on
the ST platform, so it is possible to find this on ST-archives also!

Bye, Olli

>Chuck Rickard
>(chuck@umbc5.umbc.edu)

Chuck, Rio Computers was going to be the US distributor of
A-O, last I heard. I called them a few times in August to
find out about it, but it seemed that it was always destined
to be there about a week after my call. Now that the academic
year has started again, I don't really have time for hacking
around like that anymore, so I've given up on trying to find
out A-O's current status. At this point, I'll probably wait
until next summer...probably a better idea to see/hear about
it more before trying it out anyway.
Be sure to let us know how it works out!

>As the title says, what is the current Status of Autoswitch Overscan for
>the ST? I remember hearing about it, but have seen it available nowhere
>in the U.S. so far. Am I looking in the right places? :-)

You can buy Autoswitch-OverScan at RIO Datel in Las Vegas, Nevada. I think
RIO is doing advertisments in some ST-magazines.

We also have an AutoSwitch-OverScan for the TT which we showed at the
ATARI fair in Duesseldorf. With OscanTT you get:

TT-Mid: 640x480 832x496 +34 %
TT-Low: 320x480 416x496 +34 %
ST-High: 640x400 832x496 +61 %
ST-Mid: 640x200 832x248 +61 %
ST-Low: 320x200 416x248 +61 %

These values are monitor independant. The 'autoswitch' is configured with
a CPX-module.

Greetings, Karsten

2375. Re: drawing lines with uniterm vt100 emulation

> around with this all day and haven't been able to get anything
> to work.
>
> Thanks in advance. :-)
>

It's very simple: The vt100 terminal can only display 7 bits
characters and proide 3 distinctive characters sets: one is the US ASCII,
the second is UK ASCII and the 3rd is the line drawing set. In addition you
have two registers in whitch you can put any of theses characters sets. TO
switch tgheses registers you must use characters SO or SI. Bellow is a table
containing the sequence to affect a charecter set to registers:

Registers
G0 G1
UK ESC(A ESC)A
USASCII ESC(B ESC)B
Lines ESC(0 ESC)0

In my BBS software i assign USASCII to G0 and line drawing set to G1
so i just have to send SO or SI to switch from one to another.

You can also use the Tektronix eulation to draw lines but it's not so
easy. All of these informations have been taken from the vt100 manual comming
from Digital Equipment.

Don't do this. Really. The more programs that go poking around in the
internals of the operating system, the harder it's going to be for
Atari to come out with a better (e.g. multitasking) version of TOS.
There are already all sorts of silly bugs being perpetuated in TOS for
the sake of "compatibility".

>The reason why I need this information is because I need to write my own
>malloc and free functions. I have to write my own functions because I
>need to use malloc and free inside an interrupt (this would normally make the
>ST crash).

Reserve the memory ahead of time, e.g. before you install the interrupt
handler, do a Malloc() of a big chunk of memory and have your malloc()
and free() do the allocating from this chunk. (Just out of curiousity:
why do you need to do malloc() and free() inside an interrupt
handler? It may be that if you re-think the way you're doing things
you might be able to avoid this, for example by having the interrupt
handler set a flag and the main program do the allocation.)

>I have seen a program on terminator in the programming directory (memaddrs.arc
>- or something like that) that prints a list of allocated and free memory.
>I tried to disassemble it but it was written and C and it is difficult to
>follow.

The best way of printing a list of free memory is to have a loop that
does Malloc(-1L) to find the size of the largest free block and then
does Malloc(size) to allocate that block. The best way to print a list
of allocated memory is not to do it at all. (These methods will work
under MiNT, RTX, and any version of TOS; others may not.)

Outstanding would be defined as follows:

TT with a possibility to choose in bootup, between TOS & UNIX and then supplied
with the DOS emulator they promissed in original TT-spec.

and personally I don't mind wether it(the emu.) ran on top of unix or tos...
but what ever happend with this emu, what they described as " a fast 286"
???
and the wildest was that it would be submitted to TT purchasers afterwards ?!?

Message-ID: <1991Sep3.132149.7142@vax5.cit.cornell.edu>
Source record: 229207

The reason I need to call malloc and mfree inside an interrupt (trap #13 to be exact) is because I am writing a variable size ramdisk. i.e. grows when you need it and shrinks when you need it. So without being able to allocate memory on the fly the whole program is pretty usesless.

>but what ever happend with this emu, what they described as " a fast 286" ???
>and the wildest was that it would be submitted to TT purchasers afterwards ?!?

I realised a long time ago that anything a company promises they will ship to
you a later time will never be sent to you. Even if the product is made, they
will end up charging you what everyone else will pay for it.

[pure speculation follows]

Atari's original specs for the TT were more like a wish list. They got the
bosses together and said, "Hey huys! What do you want this sucker to do?"
Everyone yelled out what they thought would be great in that machine. They
then let this list leak out to the public to hear their reaction. Everyone
said "Great! We want it!" At this point, they gave the list of "specs" to
the designers, who in turn said, "What??? How in the heck am I supposed to
do that?" Management then said, "Do what you can. They'll buy whatever we
make anyway..." So, the TT is born! Unfortunately, its nothing like the
"sonograms" predicted... :-)

So, to make a long story short... (too late)

Like a child's christmas list for Santa, we got only a few of the items on
that list. Most likely, the IBM emulator is in a same file with the card
box, PromiseLAN, the Multitasking TOS, and the Tower TT/X.

[end note: Don't take me as an Atari basher. I still own two, but I also
realised the merits of other computers as well. And, to quote other users,
I like the computer, just not the company.]

2381. MX2 Multitasking Kernel

Newsgroup: comp.sys.atari.st
Date: 1991-09-03 18:39:39 UTC
From: jmack@b11.ingr.com
Message-ID: <1991Sep3.183939.1107@b11.ingr.com>
Source record: 229211

I recently got a copy of MX2, the multitasking kernel, from the
Atari.archive. I am running Gulam as a shell with it. Some things work
kind of screwy, particularly the commands related to processes (status,
kill) or related to the rs232 port. The system always crashes when I
start the script that sets up a background shell that gets I/O to/from
the modem and then hit a few <returns> in rapid succession.
Is there a newer version of this software? Should I toss it and
spend the bucks to get Minix? Am I doing something wrong? Any
information on MX2 would be appreciated. Thanks.

The IBM RS/6000 has a very good dos emulator. It emulates an XT at AT
speed (or at least thats what people say). I don't use dos so I can't
really judge the speed. It is faster than any XT I have used though.
(And I did get Battle chess to run on it.)

2385. PC Emulators- Worth the money?

Newsgroup: comp.sys.atari.st

From: longj@lonex.rl.af.mil
Message-ID: <1991Sep3.204051.8278@lonex.rl.af.mil>
Source record: 229216

I have been frustrated to discover that several software houses I used to buy from have discontinued carrying atari-st titles! I don't want to sell my STe, it does what I want it to with a minimum of hassles. But... I would like to get some of the more popular software titles, and since they all are for MS-DOS machines, I was considering an IBM Emulator.

Does anyone have comments on the relative merits of the available ones: PC-Speed, Supercharger (save the breath on PC-Ditto!) and others? Specifically, I am wondering about ease of use, compatibility and speed.

Thanks for any help you can offer!

Jeff

> Have someone tried this program?

I did. It works *great*, it's really an ingenious piece of software.
No, I don't have any problems with it, and never had.
You really should check your auto folder prgs and accs for collision,
and maybe send an email to the author if you found something.
The docs may give you a Maus net adress, it's easy to convert to Usenet:

Adam Atari @ ABC

becomes

Adam_Atari@abc.maus.de

Simply write an underscore between 1st and 2nd name and add '.maus.de' after
the city code. This should help with many german programs since the Maus
net is the most popular net in Germany.

>Is all this macho cynicism intended to make you seem intelligent? Grow up
>and try again.

Well, let them have their own opinion.

But since my message started this conversation, I want to explain what
I was talking about.

I said that I'd like to see the TT or Mega STe with a PC emulator among
other things and then a few people said, "Oh, I'm not programming anything
with an Intel chip in it."

Then don't program on the Intel!

You can program on the Motorola and just let people run their IBM software
using Intel's chip.

Like it or not, I'd estimate that IBM and compatibles have 90% or more
of the personal computer market. A computer will have to be VERY good
in different areas that compatibles are not in order to at least stay in
competition.

While the ST finds that niche or niches, it can run IBM software.

2394. Atari <--> IBM

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 02:26:41 UTC
From: defrain@ei.ecn.purdue.edu
Message-ID: <1991Sep4.022641.11939@noose.ecn.purdue.edu>
Source record: 229227

Regarding interchanging Atari ST disks with a PC,

Apparently, some users can use disks on either machine w/o any trouble.
However, the early TOS versions are not fully compatible. In such a
case there exist utilities to format a disk on the Atari for use with
a PC. Vise versa, a disk formatted on a PC in 720KB should work with the
ST -- not always however. If this fails for anyone then try configuring
MSDOS to recognize it's 3.5'' drive as a 720KB and do not flag the
format statement (i.e. one can use a 1.44MB drive to format a disk
to 720KB by flagging the format statement -- this did not work for myself).
This can be accomplished in some PC's by changing the CMOS settings at
bootup.

Now that I can transport files Atari <--> PC I've ran unto another
problem. The unarcing program available via FTP named ARC.TTP does
not function as I would expect. I run the program in the same folder
as the file to be unarced with the command line

xh (filename).ARC *.* or just x (filename).ARC *.*

and ARC.TTP appears to load w/o doing anything and then I am returned
to the open window environment -- no unarcing!!!

When using a program called UNARC Elite V2.0 I obtain data errors while
unarching *.ARC files and the resulting *.PRG files give bombs or TOS
errors. Anyone know what the problem is here?

thanks for continuing help,

Paul

2395. ST/STe & HDs

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 03:23:14 UTC
From: mlake@irscscm.UUCP
Message-ID: <1991Sep4.032314.16796@irscscm.UUCP>
Source record: 229013

I'm having a screwy problem.

I have a 520ST and a 1040STe. I also have 20 meg and 80 meg Supra HDs which I normally run daisychained. Everything works fine with the 520ST. But when I plug the HDs into the STe I can't boot, in fact I can't even power up. The busy light on the 80 HD (the first drive in the daisy chain) freezes on (the busy light also freezes on if I try to power up the 80 HD with the connector not plugged into either ST). If I connect the 20 HD directly to the STe then I can boot up but I can't access all the files on the drive. I get read errors with certain files.

Here's the screwy part ... if I boot everything with the 520ST, then unplug the HD and plug it into the STe, then boot the STe everything comes up fine and I can access all the files!! But I have to do a complete boot (bring up the desktop). If I only power up and then unplug the HD from the ST then the busy light will freeze on once I plug it into the STe. Why is all this happening?

Also, it seems I need a floppy disk in the internal drive of the STe even with autobooting turned on for the system to come up. Is this normal?

2396. Hard Disk Problems

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 03:44:23 UTC
From: ac365@cleveland.Freenet.Edu
Message-ID: <1991Sep4.034423.10665@usenet.ins.cwru.edu>
Source record: 229217

As some of you might recall, I was having some trival problems with my Toadfile 44(syquest555 with ICD board). Well, thanks to a couple of suggestions by you I was able to keep my system going without any serious catastrophes. I spent the summer woking at a research facility and I brought my computer with me. I have to admit, not a single HD problem for two months, except for one bad sector which was mapped out the first day. Well, now my computer is here with me at Penn, and I am noticing lots of large problems with the system. Lets see what we all can come up with once I tell you what its doing.....

Just to refresh, I'm running a 44 megabyte removable media harddrive with my Mega 4ST and a helpful application called DC Desktop in the Auto folder. Everything was going good for the first couple of days, and then little bombs appeared on the screen when it would do the startup routine loading the DC desktop programs. I erased the troublesome files and reinstalled them from the original floppy. Well, the bombs still appeared, yet in different places. I worke don this for some amount of time and life was not getting any bette. I made an emergency backup of the key stuff on my C drive and copied a few graphic files to the D: partition.

Life still didn't get any better as I worked with the system. I decided that it was time to zero the partition and reintall from scratch. It now booted nicely once I put the boot files back in. But everything that I tried to restore just wouldn't run. Flash and Wwriter which were reinstalled from the original source disks would bomb upon loading.

I called ICD today and talked to a helpful technician who took me through some other things to try, but no avail. I convinced him to send me another ICD program disk (i figure that since I configure my C partition from the floppy and that there are some major problems that maybe the source disk is corrupted.) The interesting thing is that D: and E: partitions just work like normal. Some files bomb on D: and E:, but not everything. I have been able to install Flash and Wwriter onto E: for now and this works (based on the ability to send this message out!). I can't put any programs into AUTO or any desk accessories without it bombing on bootup (annoying because I can't use TURBOST), but anyhow.....

H E L P !

ANy suggestions would be greatly apprciated!

Please email me at ac365@cleveland.freenet.edu with any ideas or if you just require clarifications of my ramblings.

Thank you immensely..

Also, if any one knows of Atari service in Philadephia, pls let me know!

ZZ

2397. Re: Epson 9 pins and GS

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 03:57:18 UTC
From: rosenkra@convex.com
Message-ID: <1991Sep04.035718.22010@convex.com>
Source record: 229220

first off, tim posted gs 2.2 rev 0 to atari.archive (only) so far as
i can tell. there were problems with the opson 24-pin driver as well.
however, these were cleared up with rev 1 which i got directly from
him. the 24-pin driver works as far as i can tell perfectly (thanx tim!)
and i hope whatever changes go in to the 9-pin driver do not damage
the 24-pin driver. probably not. since tim does not have an epson,
be very explicit when describing errors. even better, get the source
and fix it, sending him a patch.

make sure you are using the correct -sDEVICE=xxx option and the proper
-R switch as well. for my lq1000, these are -sDEVICE=epson -R180x180.
this might be -sDEVICE=epson9 for yours (check docs, my memory fails).
note that the pr.ttp program has an annoying deskjet reset at the end.
this is easily fixed if you have a compiler. otherwise, print one file
at a time and power cycle (the printer, of course) since the escape
sequence to page eject on the dj hoses the epson.

i have ported mgif to GNU c now and have added a .ps file dump. i can
take GIF images, dump a .ps version, crank it thru GS, and print on
my lq1000. it works great (except for a slight problem with aspect
ratio in the .ps file).

good luck. once you get it going, it should be fun, tho don't expect
miracles from a 9-pin...

Yes, it is availible in US by Rio in Las Vegas also from Talon in Solana Beach
and it's to change SC into AT compatible.
>
> Can you put a Super VGA card and a Adlib or Sound Blaster card in the
> expansion slots for playing VGA PC games?
I might be wrong but from the memory of seeing the AD, the expansion slot
would accept AT type card as well, but you will need new case to hold it.
>
> Can the PC side access Atari hard drives?
Supercharge use the ST to address the hard drive, yes you can access the ST
partition also, just need to setup right in config and autoexec file.

> Who makes them and where would I get one from in Australia?
It's by Beta systems in Germany and Condor Trading LTD. in Alcermaston
6 Bacchus House
Calleva Park

I have the software version of PC Ditto, and got burned on the
hardare version.

Basically, my main reluctance to get one of the newer hardwar
emulators like PC Speed is this: I'm still tied to the emulator for
expansions and the like. If I bought a PC clone, I could upgrade using
off-the-shelf IBM replacement parts, upgrade boards, and the like, and the
prices within the IBM community are very competitive.

However, for me to get replacement or upgrade boards for the
currently-available ST based IBM emulators, I'm stuck with getting only THEIR
boards. Those companies might be as likely to fail as Avant-Garde did, and
their rices are higher to boot.

In short, if someone marketed an IBM emulator that used real
IBM-compatible PARTS-- like a super-VGA board, 386 accelerators, hard drive
controllers and the like-- I'd get it. But as for now, I'll have to save up
to buy a real PC clone.

| >
| >While talking about the ATW it is now available for 2500pounds with
| >educational discount. (Thats Half price!)
|
| So what? You can go out right now and buy a 21 MIP Sun SPARCstation
| ELC for the same price in the US (about US$5,000). Wouldn't it be
| better to own a SUPPORTED workstation that runs a real unix and that
| you could do real development work on?

Have any of you been debating between getting an Atari TT or a Next Station? It seems that the educational discount for a Next Station in the US is approx. 3,200 $US for 8 Megs and a 100 Meg disk plus gobs of software. Here in France a similarly configured TT/8 is in the same ball park 20,000 FF and the educational discount is only 10%.

| p.s. That $5K figure is LIST price, not educational discount. That is
| probably even much cheaper.

The Next Station already has Unix(tm)! Unfortunately, here in France you have to multiply the price by at least 2 in order to get a Next Station.

Wishfully thinking...

Sorry if you're offended, but every Intel processor I've seen has been a complete pig's breakfast. Look at the 80x86 series. Even the new "flagship" i860 has some truly awful bugs in the instruction set.

Take it to alt.religion.computers if you feel like arguing.

Source record: 229242

Hi again,

I went to the Atari Messe in Dusseldorf. After that, I had holidays,
so I was not able to contribute/read the net earlier.

I read a few article about the messe, but there is only one big thing
I would like to add:

an MSDOS emulator using the 386 processor.
Fortunaltely/Unfortunality it worked with the MEGA STE only.

They had a special "Messe" price which was 695 DM (if I remember well).
Unfortunately I did not have enough money to buy it :-(

The Printed circuit board was very well done. And it occupies a nice
empty place within the MEGA STE. No soldering required as far as I can
remember.

Beside the sockets for the 68000 and the 80386, there was another
big socket (although left open). To me it looked ok for a co-processor.

It did work with MSDOS 5.0 and could uses some partitions of harddisks
which were not being used by TOS.

As the person spoke German very well, I think they produced it there...

I do not have more information with me right now, but if there is
enough interest I will bring the information with me and post it here.

Date: 1991-09-04 12:49:07 UTC
From: ameij@vax.oxford.ac.uk
Message-ID: <1991Sep4.134907.1676@vax.oxford.ac.uk>
Source record: 229010

Hi chums,

My new employers have offered to buy me a computer. It's to use in work and at home, so I would like a (trans)portable, and as I have used and liked ST's at work and home for the last few years, my thoughts have turned to a Stacey.

There are just a few questions I have - I need to put my bid in to the equipment committee in ten days, so it's fairly urgent...

1) I will almost certainly have to run DOS programs occasionally. Can any of the internal DOS emulators (PC-Speed, AT-Once) be used in a Stacey? Does anyone have any experience of doing so?

2) Same question, re internal modems

3) Same question, re Atari 68881 coprocessor

Any other first hand views on the Stacey (particularly cf the Mac portable, which is probably the alternative) would be greatly appreciated.

Ian Johnston

>I think that's what the original poster asked for.
>
Oh sh*t, looks like I didn't read the subject. You are right, my
configuration doesn't do things like that. A way could be to run
the remote-login delivered with HERMES and then automatically start
the nn ported by some guy from Kiel, Germany, which should be able
to redirect it's output to the serial port.

My host, malihh, was running as a UUCP-BBS on an ATARI, since the
sysop bought and installed his NeXT. You should ask him about his
software. He wrote a Newsreader and all other software and as I
remember, he was offering the whole system for some bucks. His
address is: clu@malihh.hanse.de

Bye.....Michael

I have PC-Speed and I like it fairly well. I like some other people have never been able to use a modem under DOS with PC-Speed but that is the only bad side effect. Another problem is that it is to fast. I purchased "Wheel of Fortune" for my mother who has an IBM. When I tried the game on PC-Speed I barely had a chance to enter a move before my time was up.

I have not have a compatibility problem ever. But, PC-Speed offers CGA graphics which is sometimes difficult to use if the software hase allot of color built into it.

The Speed in the PC-Tools "Info" Utility rates PC-Speed at "220%", an IBM PS/2 Model 25 at "80%", an IBM PS/2 Model 30 at "180%" and an NEC 80286 machine at "285%".

>speed (or at least thats what people say). I don't use dos so I can't
>really judge the speed. It is faster than any XT I have used though.
>(And I did get Battle chess to run on it.)

I work for IBM in a Co-op job doing technical support for all IBM's AIX products. I have used the PC Simulator on the Risc System/6000 (Tandy owns the word "RS/6000" and gets angry if IBMers use it) and DOS Merge for AIX PS/2. When more than 4 four are running DOS on the same machine at the same time, the PS/2 holds up better than the RISC System/6000. Also, the PS/2 actaully has an 8086 virtual mode which the RISC System/6000 doesn't. Since so many DOS programmers avoid using the BIOS and program to little quirks of the 8086 chip, the PC Simulator just can't figure out what to emulator sometimes and then fails. I would put the RISC System/6000 at third place behind LOCUS's PC Merge product.

My point is, even if Atari makes an emulator, it isn't going to satisfy us becuase the popular software on the ST also avoids the Operating System calls an directly accesses the hardware in a undocumented way. That is "taboo" in a multi-user multi-processing operating system.

2408. STE Info Wanted

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 14:52:58 UTC
From: randyh@hpsad.HP.COM
Message-ID: <750121@hpsad.HP.COM>
Source record: 229245

Hello all,

I'm thinking about buying a 1040STE and would like to know a few
things about it.

1) Does it still have the harddisk/dma bug? I have an old 20meg
Supra drive. Will it work with the STE?

2) How hard is it to add 1meg simms? Is the memory sockected or
soldered in.

3) What's the difference between a 520STE and a 1040STE? Is the
520 missing the sockets to go to 4meg?

4) Has the workmanship improved, ei pc-board quality? My old
520ST came with all kinds of wires butched on the board.

5) Any testimonials? Are you glad you got the STE or did you wish
you would've gotten a clone?

6) Finally, I live in the SF Bay area. Any recomendations on a
dealership that will give me a good deal and *good* support?

And now for a few things I would like to sell...

Old broken 520ST. I think it might just need a new mmu socket.
I'll also throw in (away?) a non-fuctioning Aerco memory board.
This ST is a hw hackers dream come true. I will even include
schematics! Other neat options include homemade detachable
keyboard. CPU has an aluminum cover that swings off for easy
troubleshooting. TOS 1.0 and RF modulator built in.
Also included in package...
SS external disk drive. Works fine.
Atari MOUSE. Good to have for a backup.
All power supplies included.

PRICE - $100 or b/o

STAR NX1000 RAINBOW color printer. Hardly used. Will include
driver and auto prg to do ALT/HELP screen dumps in color.
This is really not a bad little printer.

PRICE - $125 or b/o

Thanks,
Randy Hosler

2410. Super Charger 286?

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 15:35:52 UTC
From: gjocc@csv.viccol.edu.au
Message-ID: <1991Sep4.103552.6856@csv.viccol.edu.au>
Source record: 229225

I am after some information on a device called a Super Charger 286.
It is a 286 PC emulator that goes on the Atari DMA bus.

Any one out there have one of these?

Can you put a Super VGA card and a Adlib or Sound Blaster card in the
expansion slots for playing VGA PC games?

Can the Atari display via a graphics card in the Super Charger?

I have heard that there will be a 386 version of the Super Charger,
anyone know if this is true and when it will be released?
(this is the product I am really interested in)

How much memory can you put in the Super Charger without using
one of the expansion slots?

Can the PC side access Atari hard drives?
Can you use a PC hard drive with the Super Charger and can the
Atari access it?

Who makes them and where would I get one from in Australia?

Hmmm at lot of questions.....

Any information at all on the capabilities of the Super Charger would
be welcome.

>us becuase the popular software on the ST also avoids the Operating System
>calls an directly accesses the hardware in a undocumented way. That is
>"taboo" in a multi-user multi-processing operating system.

What about SoftPC? Doesn't this also run on Sun Workstations as well
as on the Mac? Why doesn't Atari just license a decent emulator and
charge users for it instead of just poking its head in the sand and
hoping the demand goes away (or shops somehwere else)?

BTW, has anyone actually SEEN Unix System V running on a TT and
used it? Trade shows don't count since it is easy to control what
people do to it under these circumstance to prevent any embarassing
crashes.

Also, have very many people BOUGHT these things anyway? I've seen notes
here from a few old timer/hackers from the ST community who got one,
but has the thing been selling to real people yet? Of course, there
are always going to be those fanatics for every brand of computer who
will buy the "latest and greatest" gadget just to have it, but what

about normal consumers who walk into a computer store to buy a
computer?

Cheers,

Chris

2412. Laser Printer Problems!

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 15:45:05 UTC
From: a0067@rrz.uni-koeln.de
Message-ID: <1991Sep4.154505.124527@rrz.uni-koeln.de>
Source record: 229236

Hi there,

having too much money we bought some fancy laserprinters (not the
ATARI SLM) and now want to link them to our ATARIs.

First we got a CANON LBP-4.

This machine gives no reaction when connected to the ATARI parallel
port, but works fine when connected to any IBM clone.

Second we got a QMS PS-410. Wonderful machine with two ports and
Postscript capability.

And again we get no reaction when this QMS is connected to the ATARI
parallel port. Everything is OK when an IBM clone is used.

What is special about the ATARI parallel port?
What must be changed in the ATARI or the Laserprinters or the
connecting cable to make the ensemble work together?
Neither the parallel ports of an 1040ST, nor MEGA2 nor MEGA4
do work.

We would very much like to obtain some help or the investment
of several kDM is in vain.

Please Help

Kurt

Everytime I try to back up the internal (Seagate ST157N) drive on my TT using an ICD FA.ST 155meg tape drive, my TT crashes. I shipped the tape drive to ICD in Rockford Illinois and ICD could not get the tape unit to fail.

The internal drive was formatted with the TT hard disk utilities and before doing a backup, I run the ICDBOOT.PRG code, version 5.3.0. The tape back up software is version 2.10 beta. When I do a backup, I have TT cache off and no desk accessories (except the CPX control panel). The tape drive is set to ID 3.

I have tried two (2) different drive cables and five (5) different tapes. Crashes still occur 100% of the time.

Does ANYONE have ANY idea what could be causing my system to crash?

I have had the tape drive for 6 months and just cannot use it to back up my TT. FRUSTRATION is an understatement!!!

Good grief, if you really want all that, buy a nice, integrated, CHEAP,
1040STe. You're talking about half the STe motherboard. (You forgot
memory upgradable with SIMMs, analog joystick ports).

2415. Re: Super Charger 286?

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 16:59:39 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <172536@unix.cis.pitt.edu>
Source record: 229243

I'm not very familiar with the "Supercharger 286", though I used to have a Supercharger (i.e. I sold it because of the $$$ it would take for the 286and AT slots expansion). Before you buy one, you might wish to see how much actual IBM systems can be got for (check mail order or used - you could find some killer prices). From what I understand though, the 286/expansion upgrade WILL letyou use any AT (or XT) card, thus including VGA, etc. However, unless what I've heard is wrong (someone join in!) you could be paying like $600-$800 for this in all (you can pick up a 16mhz 286 with a harddrive for this much).

Justsome fair warning - I originally went with the SC because of the expansion possibilities, but when I finally got a whiff of the price, I said "no thanks."

I'm personally waiting for a AT-Speed16 (16mhz 286 emulator with 287 slot, does Color CGA and Tandy1000, and MONO Hercules, EGA and VGA). It's twice as fast as the standard SC (not the 286), and costs ina similar price range to the standard SC...

>(and me as well with the second question). Thanks for your time.

I purchased it against the advice of my local dealer, ATY computers in Oakland.
It did work on the mega2 in the shop, although only sometimes. I have not
successfully run it on my 1040STe at all.

It's a great concept, but it needs to mature a little still.

steve@thelake.mn.org (Steve Yelvington) writes:

> So far as I know, the only currently available ST BBS that allows Usenet
> messages and UUCP/Internet email to be incorporated into the message base
> is STadel, a variant of Citadel.

Just my $ 0.02: I wrote a BBS program two years ago and ran a BBS with
uucp interface on my machine here about 1 1/2 years. The BBS program is
network independant - the message import/export and the uucp dialup have
to be done with external programs (I did it with the good :-) old
MailTruk..., but I'm relatively sure that you could use other uucp
packages such as Mercury).

The program is in the public domain.

Since I don't work on this program any more, take the source and be happy,
change whatever you want...

a> Any great things come out of the Atarimeese in Germany?

Well, the Messe was a bit of a letdown this year. The only new thing Atari
presented this year was a new MS Dos clone, the ABC 80386DXII containing a 40
Mhz 386DX, 2 Mb RAM, etc. Atari's stand was huge in size but small in the
amount of computers that were on the stand itself. Further there were lots of
VGA boards to be seen and the new Vortex 386SX Emulator for the Mega STE. Read
the next issue of the new STabloid disk magazine for further details.

2419. Conclusions: How do I stop Control-C?

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 19:16:01 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <ePkR82w164w@ersys.edmonton.ab.ca>
Source record: 229002
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

About a week ago, I posted a message asking how to prevent the ST from aborting a program while waiting for input or sending output if Control-C was pressed. I received a number of suggestions, and here are my conclusions:

1. Use BIOS functions. Bconin & Bconout work fine to get characters and send characters respectively. They also do not wait for the user to press return on input, which was useful. I found that when I read from the file, though, I had to manually convert '\n' characters into a CR, followed by an LF for the output to the screen to look correct.

2. Use getch() and putch() to do the input and output, and use cfg_ch() to modify the functions to use the BIOS calls mentioned above. This would be more portable than the above method, but I think it might be a tiny bit slower. I had problems getting this method to work for me, but I now realize that I would have also had to convert '\n' characters into a CR, followed by an LF for the output to the screen to look correct.

I would like to thank everyone who answered my questions to offer help.

Message-ID: <u1kR83w164w@ersys.edmonton.ab.ca>
Source record: 229003

Hello. I heard that there will be a new version of Sozobon C released soon. Does anyone know the mailing address of the authors, and whether or not they will still ship the package out to people for the $10 mentioned in their documentation for version 1.0 of Sozobon C. The reason I am asking is that I don't have access to a Mail Server (like Bart) or comp.binaries.atari.st (although the second one might be fixed soon). I would like to get the newest version of Sozobon C that I can, and if this is the only way I can, I'm game. What I need to know:

1. Do they still send out the package if you mail them the $10?

2. The Address.

3. Has the price gone up?

If anyone has any information, please let me know. Thanks for your time.

A variable-size RAMdisk basically Can't Be Done under TOS from outside GEMDOS, for exactly the reasons you've discovered: you can't go around allocating and freeing memory from inside a BIOS call or interrupt.

There's another problem: just allocating memory to your RAMdisk when somebody copies a file there and deleting memory when they remove it won't do the job, because this will fragment your RAM hopelessly and nothing will be able to run. You can ameliorate this by reshuffling memory to compact your RAMdisk when you can, but that is a lot of work. And you STILL can't do Malloc's from inside BIOS, so this complication is academic.

Writing your own Malloc and Mfree is not the answer, because GEMDOS calls its versions directly, not via trap #1, when it allocates memory for Pexec. You'd have to replace Pexec, too. If it sounds like you're going to have to replace bloody great chunks of OS to do what you want to do, it's time to think that maybe you should scrap the project and start another one.

2427. TOS problem in STE?

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 20:55:26 UTC
From: rwilson@ra.UVic.CA
Message-ID: <1991Sep4.205526.21325@sol.UVic.CA>
Source record: 229001

I'm posting this for a friend without net access. Please respond via email
to: mhorie@ra.uvic.ca

Your followups won't be seen by either of us, since he doen't have access,
and I don't have the time.

I have an interesting problem on my ATARI 1040STE. When I try to run a certain
program, TOS tells me that it can only be read (even though the program
has a .PRG extension). When I cancel this message, and try to run the
program again, everything works fine. This always happens, regardless what
disk I am using. However, if I change the name of the file
or folder that it is in, this will not happen. This did not happen
on my 1040STF. Is this just my computer, or is there a bug in TOS?

Michael Horie

2428. Fnordadel v1.32 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-09-04 22:31:56 UTC
From: adrian@cs.UAlberta.CA
Message-ID: <adrian.684023516@steele-lk>
Source record: 229247

I have placed the binaries, documentation and source code for version 1.32
of an ST BBS package called "Fnordadel" on atari.archive.umich.edu. This
somewhat whimsically-named system is a derivative of Citadel; specifically,
it's a much-improved system based upon David Parsons' "STadel". It is
currently being run at a number of sites across North America.

The following is a brief excerpt from the binaries README:

-----snip snip-----

This, then, is Fnordadel. It's for running bulletin board systems. It is
of the Citadel flavour; in fact, it's linearly descended from the original
Citadel. It's for the Atari ST/TT series of computers; minimum setup is a
512K ST with one disk drive, but more of both RAM and disk space always helps.
Like all Citadels, it excels at running conversation BBSes, though there is
also substantial support for file transfers. It networks (using standard
Citadel networking). It's easy to run (self-maintaining). And, best of all,
it's FREE.

Fnordadel comes in two archives. The one you got this README from is the
main binaries archive, which contains everything you need to run Fnordadel.
It is named `fnXXXbin.zoo', where XXX represents the version number such as
`132' for version 1.32. The other archive is `fnXXXman.zoo', which contains
the ASCII version of the Reference Manual. It is quite large, which is why
it is packaged separately, but in our humble opinion it is quite worth
getting.

There is a third archive called `fnXXXsrc.zoo', which is a huge thing
containing the full C source code to all Fnordadel programs and the associated
sources for the documentation, including the nroff source for the man pages
and the Texinfo source for the Reference Manual.

-----snip snip-----

The specific files are named "fn132bin.zoo" (441k), "fn132man.zoo" (183k),
and "fn132src.zoo" (519k). The archives are packed with Zoo 2.1, so you'll
need that to extract them. I have also put "fn132-README" with the
archives, in case you want more info before grabbing the admittedly large
archives.

Mail me if you have comments or questions.

>of the 68000? If it is because of TOS is there any way to get around it?
>Any help would be much apprecaited...

This is due to TOS it is not written for nesting TRAP calls, but the 68K is
capable of doing that, why not it just pushs the Programcounter, Systemregister
and something else onte the Supervisor-Stack, and this can happen as long as
you have stackspace available and are not overrunning other Data.I read once
something about nesting BIOS and XBIOS (calling therm to out of IRQ) Calls
several times should bes possible, though i never checked that.

The only ones (of the reset-resistant variety) I've found are the Codehead Ram Disk (on the Codehead Utilities Disk) and Keith Ledbetter's L-Ram, part of his LUTILS, in utilities/lutils.arc on Terminator.
The Codehead one is terrific, in that you can set it up at *and remove it* at any time without re-setting.

>The reason I need to call malloc and mfree inside an interrupt (trap #13 to
>be exact) is because I am writing a variable size ramdisk. i.e. grows when
>you need it and shrinks when you need it. So without being able to allocate
>memory on the fly the whole program is pretty usesless.

Perhaps you're thinking about this the wrong way. The reason you can't call Malloc from inside trap #13 is that GEMDOS isn't re-entrant, i.e. if someone does Fwrite() to your ramdisk, and GEMDOS calls the BIOS to do your i/o, and your BIOS ramdisk routine calls Malloc, there's a crash.

So perhaps what you should do instead (and it's a *much* cleaner solution than fiddling with GEMDOS' allocated memory buffers) is to catch the ramdisk calls at a higher level, i.e. at the trap #1 level instead of trap #13. If the Fwrite/Fread/Fopen/whatever call is for your ramdisk, you deal with it (and you can at this stage call Malloc, since GEMDOS hasn't been entered yet; just be sure you set the GEMDOS _run variable (which is documented) to the basepage of your ramdisk program before calling it, and reset it to the old value after returning). If the GEMDOS call isn't for disk i/o, or isn't for your ramdisk, you pass it along.

>Are there any good ST magazines still being published in the U.S., and if so
>does anyone have an address or phone number for them?

My current favorite is ST INFORMER. 12 Monthly issues cost $19.95. This is primarily a news and reviews newspaper, with some tutorials. They are usually the first magazine to carry news about new products. Their address:

SUBSCRIPTIONS
909 NW Starlite Place
Grants Pass, OR 97526

Another good one I subscribe to is CURRENT NOTES. This includes more columns and tutorials than ST INFORMER. The columns range from very good to very boring. It costs $27 for 1 year (10 issues, no issues in January or August). Their address:

CN Subscriptions
122 N Johnson Rd.
Sterling, VA 22170

2437. Gemini/Fonts

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 05:58:03 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <172870@unix.cis.pitt.edu>
Source record: 229033

Got a problem maybe someone can help me with:

I wish to add some other fonts to be used with Gemini (other than
the SYSTEM and 2 Gemini fonts), but for whatever reason cannot figure
out how to do so properly. Here's what I tried:
- copy all the new fonts to the same directory as the Gemini fonts
(C:\GEMSYS\FONTS\)
- edit the ASSIGN.SYS file, adding the name of the fonts to each
section (i.e. ST Low, etc)
-and reboot

But when I load up Gemini, it seems that only the original
3 fonts are there. Am I doing something blatantly wrong?
BTW am using the AMCLIGHT file found with Gemini)...

Any help would be appreciated...

The floppy in my 1040ST died, so I went out and got a Mitsubishi DSDD drive for $50 and threw it in last night. At first, nothing worked. OK, turn over the ribbon connector, that's better. Hmm, still not right, oh yeah, use the drive select jumper to select drive 0. Now it reads all my floppies. Try to format a blank floppy...nothing!! "Drive not responding...disk may be corrupted".

???I'm totally confused. I don't hear the head moving around when I try to write or format. The drive is brand new and was inspected by the dealer before shipping. I'm thinking there is some other stupid jumper or switch on it somewhere.

2444. Need questions answered

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 10:53:52 UTC
From: 72347.2767@CompuServe.COM
Message-ID: <910905105351_72347.2767_EHC43-2@CompuServe.COM>
Source record: 229011

I own a 1985 vintage 1040ST with the 3D Z-Ram (populated to 2 meg) and Rainbow TOS (6 chip set). I use my ST for writing (2-3 hours a day when I'm not teaching), programming (as much time as I can squeeze out), DTP (run a small national newsletter for writing teachers), and telecommunications (moderate the Computers and Composition Digest). I'm thinking of upgrading parts of my system. I've thought of a number of possible options but need some advice.

Upgrading the Monitor
=====================
One upgrade path involves the monitor. I like to use color because I can see it better. I currently have the SC1224 monitor (and like its crispness in spite of the lower resolution). I've thought of upgrading the monitor to one which could handle higher resolutions in color or monochrome. I suppose I'm talking about a multi-sync here. However, a colleague has a 386SX with a high res VGA (640x480?) color which to my eyes is not as crisp as my lowly 1224.
Question 1:
What type of monitor will work on an ST, providing high res mono, and medium or low res color with at least the same crispness as my lowly 1224?
Question 2:
Which monitors from question one will also work on an STE with its new resolutions or on a TT?
Question 3:
How do high res color monitors handle monochrome? Do they get fuzzy? Do they allow me to assign a given color for the background and another for the foreground (say grey and black respectively)?

The ST itself
=============
I'd really like to have an ST with more resolution choices. I'd also like a larger case (like those PC-AT machines) with a power supply capable of driving the ST with 4 megs of memory on the Z-Ram, one floppy, and my two Supra drives. One way to get some of this is an STE; another is the TT--a 68030 would be a treat for this old 68K hobbyist. I hesitate buying an all-new system because I already have two "stand-by" machines from the early 80s. It would bother me just to set the old ST aside.
Question 1:
What upgrade paths are there for making my ST act like an STE or TT?
Question 2:
Does Integrand (or some other company) make a box that can hold the ST main board, floppy, hard drives, &c.? How would I connect a keyboard to such a modified ST?

ST Software
==========
I have a gigantic hypertext capable program that supplies a CLI, a full text editor, disk management, C-like (byte-compiled) macros--the whole nine yards. My teacher colleagues have all been sucked into the PC world. They like my program, but it only runs on the ST. Much of it would port to another system. (I ported an early version to the ST from CP/M 68K in 1986.) But recently I've added user installable menus and all that nifty-keen GEM stuff (that I never use). I'd like to port this code over to the PC (and, dare I say, the Mac).
Question 1:
Are there any source-code translators that can convert GEM calls into source that a C compiler for MS-Windows (or for the Mac toolbox) will compile?
Question 2:
I mentioned the program does hypertext stuff. Are there any Spectre users familiar with StorySpace on the Mac? I'd like to write a conversion program that will convert the CONTEXT files and macros from my ST program into a form that StorySpace will recognize.
Question 3:
Are there any writer/programmers with 2meg or more systems interested in helping me beta-test this software before wide release. A version is available on CIS, but the ST user community on CIS is rather small. Very few have downloaded the 400K+ total files the program relies on.
Question 4:
What is the current ST development C compiler? I use Alcyon--I know everyone thinks it's a dog, but I've found it to be (with the proper cajoling) practically bomb proof--which I've used since the old CP/M-68K days. I also have a copy of GNU-C, but it requires so much memory, that large programs that Alcyon compiles just fine won't compile on my system (2.5 megs!) because it runs out of memory. I only use it when I'm verifying a program before porting it to a Vax--easier to develop on the ST and then just compile the code on the Vax.

If you've gotten this far, thanks so much for your time. If you can help me out with answers, you can reach me at the addresses in the signature or through the `comp.sys.atari.st.tech' newsgroup. While I am cross-posting this to the `comp.sys.atari.st' newsgroup, I don't have regular access to it.

With the current version of Gemini, you can only use monospaced fonts.
All other fonts won't be displayed. Might this be your problem?

Source record: 229169

mforget@ersys.edmonton.ab.ca (Michel Forget) writes:

>In all of my programs that use text output functions, pressing control-C
>during an output causes the entire program to terminate. THIS IS
>ANNOYING! How do I prevent this from happening?

If a GEMDOS program is going to terminate, which may happen either
intentionally by calling Pterm(retcode) from the program (exit()
or finishing main() both result in a call to Pterm() finally)
or unintentionally (prior or during a call to a GEMDOS input/output function
CTRL-C has been pressed), a exception routine evt_term is called within
GEMDOS. This routine may be used to avoid termination of the program.
evt_term is the vector $102 and the routine executed by a call to
evt_term may be changed by the use of the XBios routine Setexc():

```
void (*pfv_old)();
extern void ctlc();

main()
{
pfv_old = Setexc(0x102,ctlc);
/* program */
Setexc(0x102,pfv_old);
}
```

ctlc may be the following routine, which needs to be written in assembler,
as manipulation of the stack pointer is necessary:

---cut here------cut here------cut here------cut here------cut here------cut here---

```
* CTRLC.S
*
* If ctlc is installed (by the use of Setexc()) as vector $102, programs
* are not longer terminated by pressing CTRL-C during output. In fact
* every call to Pterm(retcode) either from the active process or from
* GEMDOS will return without terminating the process. Therefore it
* is essential to remove ctlc from vector $102 if the process is
* going to finish (if your library has it, you may use atexit() for this
* purpose).
*
* WARNING: this hack is critical. It has been implemented on the basis
* of intimate knowledge of GEMDOS internals. Actually it has been tested
* with TOS 1.0, TOS 1.2 and TOS 1.4.
*
.xdef ctlc
*
```

```
* Stack on entry:
*
* (a7) return adress into Pterm
* 4(a7) adress of ctlc
* 8(a7) stackframe of Pterm
* 12(a7) return adress into caller of Pterm

.text
ctlc: ADDQ.L #8,A7 ; pop return adress and ctlc adress
UNLK A6 ; remove stackframe of Pterm
RTS ; IF PTERM USES REGISTER VARIABLES THIS WILL FAIL !

---cut here------cut here------cut here------cut here------cut here------cut here---
```

After all, that Ctrl-C is terminating programs, is not as bad as it looks on first sight. Only for interactive programs like editors or spreadsheets or the like you should use either this routine or BIOS I/O as recommended by other authors. A bprintf() routine may be easily implemented by the use of vsprintf() and Bconout().

| >educational discount. (Thats Half price!)
|
| So what? You can go out right now and buy a 21 MIP Sun SPARCstation
| ELC for the same price in the US (about US$5,000).

What you forget is that although the exchange rate is about $1.7 : £1,
generally computers cost about 1.5x or 2x as much over here as they do in
the USA.

For example, over here a SPARCstation is about £5000, not $5000.

2450. two bugs in PBMPLUS (ST-version)

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 14:12:15 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991Sep5.141215.23888@informatik.uni-erlangen.de>
Source record: 229018

Hi folks,

I've downloaded the PBMPLUS package from atari.archive not
long ago and last night I've found two 'bugs':

I tried a
giftoppm foobar.gif > foobar.ppm
Worked well so far. The next try was
ppmtogif foobar.ppm > foobar2.gif
Now, here occured an error. I checked the output file - one byte
long. The error message was something like:
"Found junk were an integer should be".
Hmmm ...
Thank god I had the sources and did a 'grep' for the error line.
I've found it in libpbm2.c. And there located the problem.
All tools accept TAB, NEWLINE and SPACE as hard spaces this works
fine on UN*X systems (EOLN marker is one NEWLINE). But the ST
builds a EOLN by concatenation of two chars, CR *and* NEWLINE.

So obviously ppmtogif chokes on the additional '\r'. There are
two possibilities to fix this, if you don't have the sources.

- build a filter which converts the first two `\r` into
` ` (spaces).

- patch all ppmto***.ttp. Seek for the above error message.
Count to about 25 from the end of the string. Look for
the byte stream 20 0C 00 09, change to 20 C0 00 0D. Now
all tools accept CR instead of TAB.

The other bug is very mysterious. I tried doing a
ppmquant 256 foo.ppm | ppmtogif > foo.gif
The error message was:
"Too many colors. Try ppmquant 256."

'ppmquant' seems buggy ... 8-(

Any ideas, comments ?

Lars

2451. IBM <--> Atari summary

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 14:22:04 UTC
From: defrain@ei.ecn.purdue.edu
Message-ID: <1991Sep5.142204.27760@noose.ecn.purdue.edu>
Source record: 229019

The problem: Not being able to read IBM floppies from the ST

The solution: First, when possible format disks on the IBM rather then the Atari. Programs exist as well as TOS versions which can do this but why bother -- just format on the PC with the drive configured as a 720KB unit. Regarding FTPing -- use a binary mode for data transfer. Sometimes we all ignore the obvious... This will work.

thanks for all your help,

pdd

I asked Bob Brodie a similar question on Compuserve a while ago, coming at it from a different angle, and got a fairly clear reply. I asked what the differences were between TOS 1.60 and 1.62, and he stated that there were exactly two differences:

1) fix for the DESKTOP.INF/low-res boot problem (formerly fixed by STEFIX.PRG)
2) fix for the memory pool problem (formerly fixed by POOLFIX3.PRG)

I don't want another full size computer cluttering up the place, I am prepared
to pay a premium for the ability to make my ST PC compatible.
Even if the ST is only acting as a glorified keyboard and floppy drive,
it will save me space, because I need to keep the ST anyway.

Printer Problems
(Atari-Silver Reed)

I'm currently trying to link up a silver reed Daisy wheel
printer to my atari, through the parallel printer port.
However, there seems to be some confusion between the two regarding
line feeds i.e. I get about one line then rubbish.

The Atari seems to only offer a very simple set-up facility for
printers i.e. Install Printer, with no way to alter control characters.

If anyone out ther has overcome a similar problem I'd appreciate
their advice.

Thanks,
David.

2455. TeX Advice

2456. Gplot - A scientific graphing program

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 17:28:22 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <12555@jarthur.Claremont.EDU>
Source record: 229014

You may remember me attempting to post gplot earlier this summer. I went to Japan this summer and tried posting it before I left, but failed to get a good version out there. I'm back, and I think I have sent a good version to atari.archive.umich.edu. Try checking this file out, I think it can be very useful to students and people who need to do scientific graphing. I'd appreciate any comments about the program and I'm willing to do more work on it. Oh yeah, and please upload this program anywhere you can. I don't have access to GEnie or anything. What follows is the original message I posted about the program.

Dan (dcrevier@jarthur.claremont.edu)

I have sent a scientific graphing program to atari.archive in the file GPLOT.ARC. It is something that my father and I worked on for the last couple of years. I am a student at Harvey Mudd College, and have used it for many labs and homework assignments. My father is a physicist and has used it for many reports and briefings. We were planning to try to sell it commercially, but have decided to release it as shareware instead since we haven't had any luck finding someone to sell it, and it isn't completely bug free. It is very good for scientific graphing. It will graph sets of x-y data, functions, and differential equations. It has a powerful spreadsheet type editor for entering and manipulating data. It uses GDOS, so the graphs are printed at very high resolution to the printer and look very good. It will work on both color and monochrome monitors. I know that it works with 1040's and Mega's, but it may not work with a TT or a moniterm monitor. Also, I think it needs 1 meg (someone please post once they have tested it). The included documentation is not as thourough as I would like it to be, but it talks about all of the features of the program. It has no information about setting up GDOS. We are asking for a $15 shareware fee. Please distribute this program as much as possible, and send any comments to:

dcrevier@jarthur.claremont.edu

2457. Re: RAM disks for Mega4/ste??? Yes!

The only ones (of the reset-resistant variety) I've found are the Codehead Ram Disk (on the Codehead Utilities Disk) and Keith Ledbetter's L-Ram, part of his LUTILS, in utilities/lutils.arc on Terminator.
The Codehead one is terrific, in that you can set it up at *and remove it* at any time without re-setting.

The Mark Williams rde_sty for the Ste works quite nicely on the Mega4/Ste. It has many nice variations but the one I like the best is being able to save the ram disk image as a .tos file, which can be loaded once with whatever you populated it with:

I have drive o: setup for Turbo-C development with 1.5 meg and it just barely fits all the compiler tools, libraries, includes, emacs, and gnu-make. It get's used with the 'Master' shell and it's purpose is essentially to be a 'rom' drive. There'a around 400k left for diddling or temp stuff. *but* the cool part is that I saved the configured and populated ram drive as a binary (900k-ish) - it's a built in feature of rde. Now, when I load the ram drive, everything is there. Compiles are *SO* fast, it's simply unbelievable - saves wear and tear on the HD too.

Gulam or some other shell (like Master) is highly recommended for talking to rde - it lets you do much much more than the gui it comes with.

Thanx to all.

Grins,

Joe

2458. Atari Computer for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-09-05 17:45:32 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Sep5.174532.27417@umbc3.umbc.edu>
Source record: 229041
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

FOR SALE:

Atari 1040 ST
1 meg main system memory
Internal 720K 3.5" disk drive
TOS 1.4 Operating System ROMs
Surreal Systems internal clock chip
Atari SC 1224 Color monitor
Original super-sharp JVC model
Semi-"Home-brew" hard drive
SH 204 case and power supply/fan
ICD Advantage Host Adapter (w/clock)
OMTI SCSI-to-MFM converter
Seagate ST-251 40 meg drive (flakey)
DMA cable
Atari standard mouse
WordPerfect for the Atari ST
Abacus Chartpak
Misc. system disks for the above system
...and any other misc. Atari formatted disks that I have

All this great stuff for just $750 or best offer!

I'd rather sell the system as a whole, but if I get offers
for most of the pieces, then I'll go that way.

Anyway, if you have an offer, then make it! The worst thing
that can happen is that I'll say "No way!"

I prefer email, but if you would rather call, you can reach
me at (301) 521-0015.

Thanks!

Yes, TeX and LaTeX are viable on the ST. My wife is in the midst of producing a 550 page manuscript of a book using it. I use LaTeX for all of my own writing. One of the nice features is that I can freely move tex files back and forth between my Sun Sparcstation 1 at work and my Atari MegaST at home and compile them, preview them, or print them at either location. The only real noticable differences between the two systems are screen size and speed. The ST compiles roughly 10 pages/minute; the Sparc runs approximately 10 times faster.

Whether you should try to bring it up on your system is another matter. TeX and its associated programs and files comprise a large and complicated system. You will need the 2.5 Meg of memory. The 9 Meg of hard disk space you have available might be enough, but you won't have much left over after you install TeX and its fonts and related programs. Getting ahold of suitable fonts may not be so easy. Fonts files are generated using MetaFont for specific printers and resolutions and are quite large. Fonts generated for "write black" laser printers will work on the SLM 804, which is a "write white" printer, but they don't look as good as ones generated especially for a "write white" printer. I couldn't find a complete set of screen and printer fonts in the usual places, so I finally ended up generating one myself. This took several hours of time on a Sparc. I don't know whether it could have been done on the ST or not, but if so, it probably would have required 30 or 40 hours of CPU time or more.

Here are the components that I can recommend. All are available on atari.archive.umich.edu or on tex archives such as labrea.stanford.edu:

1. Basic TeX engine: tex version 3.1.

2. Latex macros.

3. Screen previewer: showdvi.

4. Laser printer driver: dviprint (packaged with showdvi).

Instead of 3 and 4, one can use dvips to convert .dvi files (produced by TeX) to PostScript files, which can then be printed or viewed using appropriate PostScript tools such as Ghostscript or Ultrascript.

Optional components:

5. Bibliography tool: bibtex.

6. Font generation: metafont.

In addition, you will need a good ascii text editor for preparing input files for TeX/LaTeX. TeX is not a "wordprocessor" in the usual sense and does not provide tools for data entry. I use either MicroGnuEmacs or Tempus, but any editor capable of reading and writing pure ascii files will work.

Hope this helps.

> Bart) or comp.binaries.atari.st (although the second one might be fixed
> soon). I would like to get the newest version of Sozobon C that I can,
> and if this is the only way I can, I'm game.

The new version that I've been looking at was not prepared by the original Sozobon team. It was put together by Ian Lepore, the guy who wrote the GEMFAST bindings. I don't know whether Ian wants to get into the disk-shipping racket, and at any rate I don't have his mailing address.

But as soon as 1.62i is released, I'm sure I can persuade the Minnesota Atari ST user group to package it as a Disk of the Month. MAST DOMs are available to nonmembers as well as members and are priced at $4 (US) each, plus postage. If you're outside the USA, better add a couple of dollars. Probably the best way to send funds in this small amount is to purchase International Reply Coupons at your local post office; MAST can convert them to U.S. stamps, which are always useful.

I'll post an announcement here as soon as 1.62i is released.

Meanwhile, if you want to get a jump on the mails, you could send a letter and a check or IRCs to:

MAST
P.O. Box 120016
New Brighton, MN 55112 USA

Include in your note that you want Sozobon C 1.62i (or better). You don't want 1.61i, which was on last month's DOMs, since it has some problems (all apparently fixed in the new version).

Source record: 229040

I plan on purchasing a multisync monitor for the ATARI ST.
I was wondering would the following monitors work with the
Omniswitch(?) in both monochrome and color modes.

SONY 1304 HG (the one I own now)

Panasync 1391
Samsung Syncmaster 3
suggestions?
or any others (below $350 cost).

If the Sony 1304 will work then that would be great!
I don't wish to purchase anything over $350.00 cause the ACER
that was offered to me was for $340.00 which will do both modes
right?

Thanks in Advance,
Jeff

>
>For example, over here a SPARCstation is about #5000, not $5000.

Well, if you're going to spend 5K pounds anyway, why not just take the
Concorde over to NY and buy a SPARCstation ELC and take the Concorde
back to merry ol' England. At least this way you can travel and have
a few beers while you're at it. :-)

I'm amazed at European prices. You can get a 486-33mhz system here for
less than US$3,000 also. Perhaps, that is why Atari machines don't
sell very well here. According to J&R Music World's latest pricing,
a monochrome Mega-2 STe will cost you US$1400+. Most people would
probably prefer to get a low end Mac or medium-end PC clone for that
amount of money (unless they want a MIDI machine...and the Mac is
making inroads in that market as well).

Cheers,

Chris

I disagree. It assumes that everybody else who uses your source code has the same library that you have. Even if it's popular & widespread (like MWC or something) it's still not portable.

There's a third alternative: use Crawio(c) for output and Crawcin() for input. These are GEMDOS functions, not BIOS functions, and as such are redirectable and other stuff. The redirection doesn't actually work before TOS 1.4 for some of the single-character I/O calls, but that's Yet Another Good Reason To Upgrade.

You call that cleaner?! Eric, I'll assume you had some bad drugs this morning and forgive you; you don't usually make howlers like this.

It is VERY hard to tell if a GEMDOS call is destined for a given filesystem. You have to keep track of all handles to decide which ones are open on files of yours, including stdin and stdout because of redirection. This is a COMPLETE non-solution as far as this guy's ramdisk is concerned.

Furthermore and most obviously, DON'T MUCK WITH GEMDOS. It's almost ALWAYS a bad idea. If you have to steal Trap #1 then you've probably got some serious organizational problems with your program, or else you're just doing something Evil and Wrong. The only things that steal trap #1 that I can approve of are OSes in themselves: MiNT and MetaDOS and the like. And they HAVE to.

Actually OXYD is something called DONGLEWARE which just means, that you have
to buy the OXYD Book (price about 50 DM form Aplication Systems Heidelberg)
You should be able to play the first 10 Levels after loading.
Put everthing onto a Floppydisk the .prg file into an AUTO-Folder.
Turn Off your ST & HD. Turn back on the ST and WAITWAIT WAIT till the
music starts ringing your ears. The rest should be easy (OXYD says the rest)

Wolfgang

Hi Annius,

Here are some answers:

> It seems to me that all OTHER text editors load files about
> twice as fast as my program. I use one straight Fread(). Do

1. The fastest way loading a file is a straight forward Fread. You also might use Bios-calls to load a file *BUT* then you have to care about the file system and your program will fail if there is another file system instal-led (e.g. Network). Perhaps Your disk ist verey heavily fragmentated, this increases the time to load a file very seriously.

> Does the ATARI AES send ANY WM_NEWTOP messages? I never seem to

2. The WM_NEWTOP message is sent to your program when *YOUR* window is new toped. You won't get a message when another window is opened or topped. Therefore you have to wait for a time event an look whether *YOUR* window is top or not.

Hope this helps.

Anyone have a hex file for 1st WordPlus for the Star NX-1000 printer? I tried the Epson files, but I can't get bold NLQ and when I corrected the hex codes within the Epson file to correspond to Star nlq bold, I started getting quadruple line feeds when I used italics. (although I didn't touch the italics or linefeed coding. Very weird).

Anyone who wants an IBM emulator for specific applications
such as games, and for graphics capabilities such as VGA,
and for expansion options, should buy the only REAL PC emulator,
an actual IBM style system.

A used turbo XT system will probably cost less than an ST
emulator, will run ANY pc program, and will be expandable to
use just about ANY peripheral you could ever want.

An ST emulator should only be for someone who doesn care about
expansion, and who doesn't have any serious applications in
mind.

As good as they are, the ST pc emulators will never match even
the most basic true PC...

On the IBM emulator, I have heard of I THINK PC-Speeds being
put inside a STacy - you might want to talk to a STacy owner or
possibly a dealer about that...

On the MAC side, just get Spectre GCR and the MAC ROMS, and you have
a PORTABLE MAC for a WHOLE LOT LESS than an actual MAC portable...

If you have the $$$ and space (see below)...

>A used turbo XT system will probably cost less than an ST
>emulator, will run ANY pc program, and will be expandable to
>use just about ANY peripheral you could ever want.

The expansion is a definite. But can you get a comparable system for
the same price (in terms of software capabilities, not expansion/cards)
Besides, who wants an XT anyways? (if I wanted one, I would have
bought a laptop for a good price) -- for me gotta go AT for
compatibility...

>An ST emulator should only be for someone who doesn care about
>expansion, and who doesn't have any serious applications in
>mind.

I agree on the first part, and disagree on the second. I used/will use
IBM emulators for programming (TurboC, Smalltalk/V) among other things.
They worked well with Supercharger (regular flavor) and should
work well with an ATSpeed. For that matter, they work on the
software PC-DITTO of all things!

>
>As good as they are, the ST pc emulators will never match even
>the most basic true PC...
>
>BobR

(referencing ATSpeed16): But for someone like me who only needs to
run basic software (i.e. anything not tied to an expansion card), then
something like the ATSpeed16 is ideal - gives CGA/Tandy color,
Herc/EGA/VGA mono (the various resolutions allow for compatibility
with many programs which are resolution-dependent; 286 (and optional
287) give compatibility to programs that use these chips specifically.
If I wanted a killer-PC system, I'd buy one - but as I have
my ST and have NO intention of getting rid of it, I don't need
2 COMPLETE systems cluttering up my already cluttered area.
I just want to be able to run software as needed, and no more.
An emulator will get one through college courses, anyways...

>bought a laptop for a good price) -- for me gotta go AT for
>compatibility...

OK, take a used XT, add a $79 '286 motherboard, and you've got an AT...

Suddenly you've got a "pc emulator" that runs 12 times faster..

PLUS... you can add 1.2 Meg 5.25 drives, AND 1.44 Meg drives for about
$49 each.. ST..?? No can do...

An Atari ST + an IBM emulator = an expensive, but limited alternative to
the real thing. If those limitations fit into your needs, great..!

But... don't expect to be able to run ALL pc applications, or ALL pc
peripherials...

From what I have read the Best is a NEC 3D, most of the otheres you have to adjust them when to go from Colour to Mono, also have a look at the Dot Pitch, go for one thats 0.28 mm

NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO

I was (we were) talking about ---F---read not ---f---read.
Fread() is a GEMDOS function, that has no buffers of its
own. It just loads a file right into a user buffer!
We're talking ATARI not UNIX, especially when it concerns
a desk accessory!

Despite the fact that I had SOME useful replies, I wish
that I hadn't posted those questions...

Do you really think it would fit? I never opened a STacy up, but judging
by the outside dimensions the space must be tight inside.

> On the MAC side, just get Spectre GCR and the MAC ROMS, and you have
>a PORTABLE MAC for a WHOLE LOT LESS than an actual MAC portable...

This is probably the BIGGEST selling point of the STacy. I'm surprised
that Atari hasn't exploited this in their advertizing (advertizing? hehe).
BTW, did the STacy ever get its FCC class B certification?

Cheers,

Chris

>This is a COMPLETE non-solution as far as this guy's ramdisk is concerned.

You're right; mea culpa. I've been working with MiNT for so long that
I forgot what a pain trying to do this from scratch would be.

To return to the original poster's request: wait for a month or so and
MiNT 0.9 will provide you with the tools you need to do a dynamically
resizable ramdisk (namely, user writable and installable file
systems). I have to agree with Allan (of course) that trying to do
this under TOS is a Bad Idea. (Actually, as he points out, memory
fragmentation may make it a Bad Idea regardless!)

> - build a filter which converts the first two `\r` into
> ` ` (spaces).

this is what i ended up doing. however, you may actually run across
real data 0x0d,0x0a in which case a search could kill the giffing.
i think you want to filter the data and convert 0x0d,0x0a to 0x0a.
read from binary file (not stdin!) and write to binary file (not
stdout!).

i think the original port was done
on a system with a unix-like environment, i.e. no distinction between
text and binary files. if there are diffs available (are there?)
you might try adding a "-o output_file" rather than using stdout.
make sure you open this "wb" in the ppmtogif code.
most shells cannot/do not make stdout binary mode.

> - patch all ppmto***.ttp. Seek for the above error message.

if you manage this, consider an upload to atari.archive.

You are correct. I was assuming that cfg_ch was available to all C
libraries. Getch() and Putch() are commonly available it seems, but I
only heard about cfg_ch in this newsgroup. In general though, I still
think that the second method would be more compatible than the first,
since it doesn't access the system directly by skipping over the library.

Thanks for the comments...

2494. Re: Stacey Advice, please

Newsgroup: comp.sys.atari.st
Date: 1991-09-06 22:12:04 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <Iclzoo200VE6A1mlUV@andrew.cmu.edu>
Source record: 229174

Hi:
As far as the STacy is concerned:
The LCD display bites. The backlight is too low and the screen has a really bad ghosting problem. Also there is a big problem with hatching on the screen when diplaying large dark areas.

The trackball is O.K., but sticks now and then, and the buttons are in a very inconvenient place, making the ball thumb oriented, not index finger based, which is difficult to controll, as well as bad for your hand.

The keyboard is O.K., but the numberpad and functionkeys are too small, which is unacceptable when you see all the extra space on the keyboard.

It weighs over 15 pounds, which makes it as a real pain in the ass to transport.

THERE IS NO INTERNAL BATTERY, AND NO FACILITIES TO INCORPORATE ONE. TOTALLY UNACCEPTALBE!!!!!!!!!!!!!!!!!!

The case design is shoddy, and some of the things that are touted as features are really just a pain in the ass, such as the port cover on the back. It is supposed to operate as a stand when open, but always slams shut while you are typing, and everyone I know who has one has just taken it off entirely.

No blitter, not even a socket.

Well, my suggestion is to skiop the STacy and the Mac luggable, and go with the ST Book, or the new Mac PowerBook, which will be out in October. At least these have a battery!!!!!!!!!!!!

mark

I heard a fair bit about Atari's new control panel, XCONTROL. I've even come accros some programs that require it (eg. DC MouseMeter). However, I haven't been able to find it; if any one either knows where I can get it, or could mail me a uuencoded archive I would very much appreciate it. Thanks in advance.

Please reply via E-mail to the address listed below, as I do not have access to this newsgroup.

>have to adjust them when to go from Colour to Mono, also have a look at
>the Dot Pitch, go for one thats 0.28 mm

I would love to purchase the NEC 3D, but the monitor is $550.00, I just don't wish to spend that much on a monitor that is interlaced at 1024x768.
I wonder what would .28mm do? the SONY 1304 HG is .25mm, if it only works with a simple adjustment, I wouldn't mind as much, but just needed to know if it is going to run with it.
TO HOWARD CHU, didn't you have a Panasync 1391? Did this monitor work for both modes? (.31 mm I believe.)

Thanks,
Jeff

2497. Recent KA9q or other slfp tcp/ip wanted

Newsgroup: comp.sys.atari.st

2498. Atari Israeli factory, bankruptcy?

Newsgroup: comp.sys.atari.st
Date: 1991-09-07 01:33:11 UTC
From: bill@mwca.UUCP
Message-ID: <1908@mwca.UUCP>
Source record: 229182

I thought this might be of some general interest (don't kill the messenger!):

Northern California Jewish Bulletin, 9/6/91, page 16:

"Israel finally OKs Atari deal, waiting for Tramiel"

"After months of haggling and intrigue, Atari and Israel have cleared what may be the final hurdle allowing the computer company to set up a plant in Israel - but snags and wild rumors still persist.
"The Israeli Cabinet gave its OK Sunday to the final phase of a deal for Atari to build a $150 million computer-parts plant there."

The article continues giving the troubled history of the deal, detailing the specifics of the factory and associated investment company, and various accusations of foot-dragging on both sides.

Continuing:

"Meanwhile, a new twist further casts the deal in doubt - a rumor that Atari will file for bankruptcy.
"[Israeli] Treasury officials said Sunday that an investigation by the accountant-general showed the computer giant is close to bankruptcy - placing doubt on whether the government will receive any returns from its generous package of grants and tax breaks to the factory."
...
"Investment analysts in the Bay Area who follow Atari stock were entirely unaware of the Israeli Treasury report that Atari may go belly-up; Lee Isgur, an analyst at Volte and Welty and Co. laughed at the possibility - which he considered absurd - of Atari folding.
"'If it were true, then their financial statement [released in early August] would be fallacious and they would be in jail,' said Isgur."

> it if this got mentioned on the network.
> 2. Can I set up an alias in the Okami shell? If so,
> how?

Hi,

I have begun writing an English documentation but I haven't completed
it yet. It's just too much... there is a doc file explaining some
principal stuff like setting up, variables, functions and some commands.
If you're interested, send me a mail.
The problem about aliases is that Okami resembles the Bourne Shell
which does not have an alias system like the C shell. So, in Okami
you must simulate an alias by an appropriate shell function. If, say,
you want lc to become an alias for "ls -C", type

```
lc()
{
!ls -C $*
}
```

This can be done by the build-in alias command which does just the same
thing, so you could as well say:

```
alias lc ls -C
```

When redefining internal commands be sure to use the "!":

```
alias ls ls -C
```

will recurse infinitely (since the shell function always calls itself),

```
alias ls !ls -C
```

will do the job (!ls always calls the internal ls regardless of shell
functions).
Remember that the alias command simply initialises a simple shell function
and has nothing to do with the csh alias.

If you wish to arrange a name for an executable file not on the PATH,
better use the hash command, so:

hash nn c:/uucp/bin/nn.prg

will call c:/uucp/bin/nn.prg whenever nn is typed, even if c:/uucp/bin
is not in the PATH. This has (almost) the same effect as

alias nn c:/uucp/bin/nn.prg

but runs faster (since no shell function needs to be called).

By the way, the next Okami version will be out soon, having a real line
editor (hooray) and being compiled with TurboC, so the ttp is 40 KB
shorter.

I just got done sending the latest Program of the week to the terminator site (atari.archive.umich.edu) where you can ftp all of our freeware programs, just do a: cd atari/dc
and viola!

I also just sent the latest program to the moderated newsgroup. You should see the file this year... :-)

DC Drop DTR will drop the computer's RS232 DTR line for one second, then reassert the line. This should hangup any modem which is connected. Program suggested by James Faircloth.

100% assembly. ST, STe and TT compatible. Program of the week.

I have a new model Atari mouse (identified by a circular ball door and large teflon sleeves on the rollers) that has withstood 3 years of hard use without a problem. I agree that the previous mouse designs sucked (those with the bare metal bars). All after-market mice that I have seen for the ST have a DPI rating that makes it very easy to overload the ST mouse scanning hardware (that is, the DPI is too high). Others have disagreed with this in a previous thread, just MHO.

The most powerful package is Uniterm, available free from
atari.archive.umich.edu. The easiest to use is Flash 1.6, from Antic (~$15).
I use both. There is also STalker, which has seen some good reviews here on
the net (I have not seen/used this one). I really like the user interface
that Flash provides, but it does not include Kermit. For those occasions
when I need this capability, I use Uniterm.

Well I would like to get one of those Datel , Key Board ones, 24 Pounds,
at least that don't use up the Cartridge Port and can be used when you are not
runing your hard drive, Plus they don't need software to drive it..

Well if the Dot pitch is better than 0.28 it could be OK in mono mode.

Don't forget a lot of MutiScan type Monitors will not work down to
the ST Colour mode as these are mainly VGA type monitors.

I seen a lot of chaps complaining about the poor results of a lot
of MutiSync monitors in the Mono Mode, not as sharp, and the need to
fiddle each time when changing to mono.

From what I have read you can have Sync problem with Sony monitors,
but they can be fixed and the Acer was one of the worse for mono use.

With the NEC 3D you can store your mono settings , so the next time you
use it in mono mode there will be no adjustments, also all of the
users of this monitor seem to rave about it when used with a ST..

I use a cheap TVM 11, I have to udjust the sceen each time, and it has
only a 0.31 mm dot pitch, not that great for a lot of mono use..

Well, that definately depends on the Modem's settings.

Mine is configured to go into command-mode w/o hanging up, just
as I prefer. I hate it having to redial, only because some
programm hung up the machine.

> rjast1@unix.cis.pitt.edu

There is a Bit in the Fontheader, telling VDI, that a Font is
Monospaced.
It is Bit 3 in Byte 66-67 from start:

Byte Number Description:

66-67 flags

Bit 0 set if default system font
Bit 1 set if hor. offset tables used
Bit 2 byte-swap flag
Bit 3 set if mono-spaced font.

On a monospaced Font, all Characters are equal extent and there is no pointer
to character offset table.

Horst.

> muck around with the slashes (you may have to quote the arguments).

Almost right Steve... The ST versions of Zoo that I've seen CAN be
used on machines running TOS versions earlier than 1.4 using the novice
commands.. The "x//" can easily be used on any TOS by substituting
"-RESTORE" or -restore" (which are both equivalent to "x//"). While not
as powerful or flexable as the regular commands, it's misleading to tell
people "you can't run it from pre-TOS 1.4 desktop"....

> BTW am using the AMCLIGHT file found with Gemini)...

I had the same problem. Basically, the problem was that Gemini apparently
can ONLY USE PROPORTIONALLY SPACED FONTS. I wanted to use a smaller font that
would allow me to legibly use 24 lines in the Console Window that didn't
extend off of the screen in medium res (wanted to use vi). Using a font
editor, it was apparent that all of the fonts I was trying to use weren't
proportional. Gemini wouldn't even recognize any font that wasn't. I
think that the docs stated that somewhere. I seem to remember reading that
afterwards. Anyway, I finally gave up and went back to using Gulam. Hope
this is helpful.

2515. Triangle Hard Disk Problem

Newsgroup: comp.sys.atari.st
Date: 1991-09-07 23:28:38 UTC
From: M.A.Rahin@lut.ac.uk
Message-ID: <1991Sep07.232838.6170@lut.ac.uk>
Source record: 229186
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This article though distributed worldwide is primarily for the UK readers. Apology to those who are offended/annoyed.

My friend bought a used Mega 2 that came with a mono monitor & a Triangle 40 MB Soft Innovation Hard disk. This is a autobooting type harddisk. On bootup the following sign-on messages appear.

Traingle turbo drive PCML Ltd.
Ver 1.2Er Room Boot RGH 12/9/88.

* (This is a British made product)

The drive works ok in ST mode. Next, my friend tried to install Spectre/128 system (V 1.9 Copyright 1988)that he bought quite long time when it was first introduced in the UK. He made five partitions. The first three are ST & the rest 2 are Spectre partitions. However, the Spectre program fails to recognise the hard disk & could not find any partitions at all. The main problem we have is that we could not find any manual for the hard rive. However, the diskutility programs are there.

The Harddisk utility & also a read.me file says that the drive is set at SCSI physical device no 7. Under Spectre we tried all possible SCSI device nos. with no result.

We seek help. If any reader of this newsgroup have any experience with this hard drive or this particular problem, please send e-mail to

Y.C.Wong@uk.ac.lut -> from within UK.
Y.C.Wong@lut.ac.uk -> from outside UK.

- Rahin

N.B. What is the latest version of the Spectre software that goes with Spectre/128 ?

No, that's right. What you need is a hardware-modification and a fitting
TOS. As it seems Atari is going to support their users.

??? CodeHead usually uses a terrible programming style (such as stealing
vectors in accessories, using Line-A, not using wind_update(), installing
housemade BIOS-ops (!!!) in accessories (!!! II), allowing zero-vdi-handles
and so on).

CodeKeys uses Line-A for its outputs. That certainly won't work on various
graphic-boards, and it had serious problems with OverScan, allthough this board
supports Line-A.

In a previous article, Roger.Sheppard@actrix.gen.nz (Roger Sheppard) says:
>Antic use to advertise a Kermit Option for Flash, but I don't know
>if its posible to still get it ..

Using Flash's 'execute' function, you can run any .TOS, .TTP or .PRG
that isn't mouse driven. (For some reason it likes to block out the
mouse.) Anyway, it is very easy to use with external protocols. For
example, I have a macro setup that will auto-zmodem to a download folder
on my H:\ partition.

Along with a lot of ST stuff, a newer version of KA9Q can be found at
atari.archive.umich.edu for anonymous ftp.

If you're calling using the Merit network, note that you can use the
PPP protocol rather than SLFP and get a significant speed increase due
to the header compression of PPP.

>an analyst at Volte and Welty and Co. laughed at the possibility - which he
>considered absurd - of Atari folding.
>"'If it were true, then their financial statement [released in early August]
>would be fallacious and they would be in jail,' said Isgur."

There are some interesting points here which are worth kicking around. The
first is that Lee Isgur was an unfortunate choice as an expert, since he's
an old Atari fan, and I believe he is or was a fairly big stockholder. The
next is that while Atari is clearly sick, the assets (on paper) are so
much greater than the liabilities (on paper) that bankruptcy seems out of
the question. Basically, after the Federated deal collapsed, Atari was
financially a burnt-out shell. Now that it's generally back on its feet
(although a lot smaller), it would be silly to ask for court protection.
But there's a VERY interesting complication: Atari's second-biggest stock-
holder, and a major creditor, is Warner Communications (or Time-Warner...it
can get confusing keeping up with company names sometimes), a company that's
in VERY SERIOUS trouble. That probably has a lot to do with Atari's bond
repurchases in the last year: Warner needed cash now, rather than more cash
later. If Warner's position in Atari was turned over to trustees, interesting
(and not necessarily pleasant) things might happen.
Were Atari to file for bankruptcy any time soon, not only would the
recent financial statement look like fraud, the bond repurchases would look
like looting of the assets by insiders. The courts frown on that, too.
So given that the really nasty work of the last couple years is over, and
that a bankruptcy would invite multiple legal problems, I think we'll have
Atari to kick around for a couple more years, at least.

I bought a copy of it BEFORE I found out about Uniterm. It's an ACC & also can act as a sort of mini-BBS. I wasn't too impressed with the kermit end & never tried the other. It's kermit wasn't very reliable when talking to a Vax. And since Flash could only be a vt52.... I MUCH prefer Uniterm.

Do you really speak of WM_NEWTOP? I have never received a WM_NEWTOP. At least
on the ST/TT you only get the WM_TOPPED message. On the ST WM_NEWTOP is not
supported.
Correct me if I'm wrong.

I purchased one of these keyboard clocks, although it was not made by Datel,
and found that all it does is to keep the keyboard processor in standby
mode while the ST is powered down.

This would be fine, except that in my case, the batteries gave out after
about a week or so without the ST being powered up for much time.

I would suggest that you enquire about the length of time that the clock
will run without the ST being powered up before buying one of these.

In the end, I bought a Dallas Semiconductor DS1216E smartwatch which consists
of a socket which fits between one of the ROMs and its socket. Once this is
in place you can forget it - all it needs is a small auto folder program to
fetch the time from the smartwatch and set the system clock.

One warning though, there is very little room between the ROMs and PSU in
some models of the ST, so fitting it may be a problem (I got around this
when I blew my PSU up and had to fit an external one 8^)

The program and some installation details are held at atari.archive.umich.edu
in the file atari/utilities/smrtwtch.lzh

Cheers, Trev..

2530. Vault 3.0 gives me 2 bombs

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 14:44:33 UTC
From: johnr@cged.co.uk
Message-ID: <1991Sep9.144433.24268@cged.co.uk>
Source record: 229111

I found a problem with Vault 3.0 a couple of days ago. I was backing up a partition on to a total of six floppies. I wandered off while each disk was being formatted and written to do other things. When I left it on one occasion I returned to find Vault had crashed with two bombs. It had finished writing the floppy in the drive and was waiting for me to put a new one in.

I restarted the full backup from scratch. Again I left it for about five minutes at one stage and it crashed again in the same way.

I tried again, but stayed close to the machine. This time I managed to complete the backup.

It seems it crashed if I left it waiting for a new disk for a few minutes. Has anyone else noticed this, or is something else going on here?

System details: Mega 4 ST running TOS1.4, blitter and ICD hard disk.

Source record: 229107
Body handling: HTML body converted to readable text

From: johnj@echo.philips.nl (John Janssen)
Subject: Re: MSDOS emulator with 386

I got quit some request so I brought the brochure with me.
It is in German, and I *try* to translate it (note that I am
not German myself).
Words between double quotes ("xxxx") are left in GErman.
Words between single quotes ('xxxx') are quoted in the brochure aswell.
v386 will stand for vortex ATonce-386SX.

The text of the brochhure follows:
.....

Vortex ATonce-386SX
386 emulation for the Atari Mega STE

- 32 bit CMOS 80386SX 16MHz CPU
- NORTON SI of 15.6 with vortex FAST-RAM (without: SI=12.3)
- Windows 3.0 runs in "erweiterten" 386-mode
- ATonce-386SX uses the Cache Ram of the MEGA STE
- Optional place for 512kB vortex FAST RAM.
- Optional place for 80387SX-16 co-processor.

v386 presents with 1 MB RAM up to 704 kB DOS basic memory and
dependent on the memory of the computer upto 3 MB memory available
as extended/expanded memory.

The (optional) 512kB vortex FAST-RAM are 4 RAMs 514256-70ns (sockets
available on the printed circuit board).
Norton SI factor 12.3 -15.6 (MIPS-Test 148% - 184%).

Grafic modes: EGA/VGA monochrome-graphic (as far as the mega STE
supports) or CGA, Hercules, Olivetti and Toshiba T3100.
Nice DOS-Font editor vortex Fontmaster and accesory vortex Hyperswitch.
Handles hard/removable disk, 360kB/720kB/1.44MB floppy drives.
Supports serial, parallel interface, Mouse and clock.
Emulates Atari laserprinter, sound and the CMOS ram.

No soldering required, fits in the 68000 socket (VMEsocket remains free).
The package contains systemdisk with emulation- and installation sw.
Standard configuration: without 80387,68000,vortex FASTram (empty
sockets are available on the printed circuit board).

.....

so far the brochure:
As I recall, it did run MSDOS 5.0
It did fit on a nice spot within the MEGA STE.
Special price on the "Messe" was 695 DM (if I remember correctly).

2532. More bugs in The Vault 3.00

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 16:18:01 UTC
From: fischer-robert@CS.YALE.EDU
Message-ID: <1991Sep9.161801.15098@cs.yale.edu>
Source record: 229109

I have found some more bugs in The Vault 3.00 which I distributed:

* The release date reads "June 14, 1991", and it should read "July 14,
1991".

* More serious, the bell which rings periodically when The Vault is
waiting for a new disk is not being called quite correctly. Every
call of the bell-ringing code can potentially crash the system.
Thanks to Michael Fischer, we have eliminated this bug in a Beta
version. Until the release version comes out, set the "Ring Interval"
to 0 in order to prevent the bell from ringing and thus the bug.

2533. Re: LZH files

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 16:25:49 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <174457@unix.cis.pitt.edu>
Source record: 229110

In article <1991Sep9.132914.24260@spider.co.uk> peterw@spider.co.uk (Peter Woodhouse) writes:
>After looking at the binaries avaiable in comp.binaries.atari.static,
>can someone please enlighten me about the 'lzh' files. What do I do with
>these files?
>
>Peter Woodhouse
>
>PS. Apologies if this is a daft question!
>
Daft? (drat, where's my dictionary? :-)

Anyways, LZH files are similar to ARC files in that they are merely
compressed files. To uncompress them, I would advise getting at least
2 programs: LZH11321 and UnLZH172 (these may in fact be LZH'ed -
look for a program called LHARC.TTP or similar filename).
The reason for recommending two files os that there are at least
2 variations of LZH which sometimes are not compatible with the other one
(there is a program called LHARC120D or something similiar - I forget
the filename) that I think can uncompress just about any of them
(I thinkl LZH11321 can as well if I'm not mistaken)).

Anyways, once you get one of the LHARC programs, it works basically
the same way as ARC. So to uncompress a file from GEM,
double click on LHARC.TTP (or whatever) and at the command line
enter "X filename [files]" where "filename" is the LZH file and
optionally [files] are which files you want to see. Also,
to view a LZH file, at the command line type "L filename".
If you are working from a CLI (command line interface, kinda like a
DOS prompt, you can type directly "LHARC X filename [files]" to
extract and "LHARC L filename" to view. Or just hit return at the
command line to see options available...

Hope this makes sense...

2534. Re: Vault 3.0 gives me 2 bombs

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 18:45:55 UTC
From: fischer-michael@cs.yale.edu
Message-ID: <1991Sep9.184555.16675@cs.yale.edu>
Source record: 229113

In article <1991Sep9.144433.24268@cged.co.uk> johnr@cged.co.uk (John Richards) writes:
>I found a problem with Vault 3.0 a couple of days ago....
>
>It seems it crashed if I left it waiting for a new disk for a few minutes.
>Has anyone else noticed this, or is something else going on here?

This is the bug that we just tracked down and that Robert Fischer was
referring to in his recent posting. It is caused by an error in the
bell-ringing code. A new version that fixes this bug will be posted
shortly (after some testing). In the meantime, you can avoid the bug
by shutting off the bell. You do this by setting the bell repeat
interval to 0.

Sorry for the problem. It's quite annoying to have a crash in the
middle of a long backup. I know---it's hit me a couple of times, too.
Thanks to you and others for reporting the problem and giving us
enough information to find the cause.

2535. I want to view PIC files!!

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 18:57:07 UTC
From: longj@lonex.rl.af.mil
Message-ID: <1991Sep9.185707.20978@lonex.rl.af.mil>
Source record: 229114

I have several pc-dos based graphics files with a .pic extension on them
and I can't find a viewer to see them on my ST :-(

I have just grabbed the PBM+ stuff from a.a. and that didn't appear to have
anything that will do it. I have also tried: viewgif, picswitch, deskpic2
and just about every other thing that evenly remotely sounded like it would
do the job!

Anyone know where I can find such a beast?? (i.e. a xxxx.pic > mono-st
display)?

2536. Help setting up Sozobon

Newsgroup: comp.sys.atari.st
Date: 1991-09-09 19:11:22 UTC
From: pdel@ADS.COM
Message-ID: <umxr01pwua@ads.com>
Source record: 229115

I just tried to get Sozobon set up and seem to have gotten myself in
a bit of a mess.

First off, when I un-zoo'd Sozobon1 and Sozobon2, I kept getting prompts
about what looked like duplicate makefiles, because the un-zooer asked
whether to yes/no/all to the file. I assume this is yes-overwrite, no-
leave, all-overwrite all the time.

That was the first glitch.

Then, after getting it all un-zoo'd, I tried compiling some of the
.c files, and I kept getting an error, 'couldn't find dstart.o',
yet there was a dstart.o in the same directory (I put EVERYTHING
in the same directory). Do I need to make separate directories for
some of these files? The manual seemed to indicate everything could
be in the same directory.

Let me give you some background on myself: I know nothing about setting
up C compilers; I'm taking a beginning C course and just want to have
something to do simple (at least right now) excercises and such. The class
uses C on a Unix platform (as does my work, which is where I do my homework),
so I'm hoping that the source code will work on my ST with not too much
editing

Thanks, Peter D.

>Put everthing onto a Floppydisk the .prg file into an AUTO-Folder.
>Turn Off your ST & HD. Turn back on the ST and WAITWAIT WAIT till the
>music starts ringing your ears. The rest should be easy (OXYD says the rest)

From my experience,

1. It doesn't work from the auto folder
2. It says the rest - in German (though this is fair enough)
3. There are NO docs readable from outside an Atari system
4. It doesn't work at all (the first Landscape is set at
impossible difficulty: every wall kills you, there
is a flying object that kills, the floor falls out
from beneath your feet, and there are no exits.

Also, I think `DongleWare' is a bit beyond the realms of what I'd like to
see at atari.archive. After downloading 450K at 2400 baud I was, to be blunt,
pissed off. It may be that the levels data is corrupted and this would not
be the author's fault. In fact, as OXYD loaded up and I saw the name

Meinolf Schneider

appear, I thought, ``Great! This guy writes in Modula-2, this is bound to
be a cool program''. And it is - or at least would be if it was playable.

Warwick
PS. A version of STrabble with support for TT-Medium resolution will appear
soon. I was so glad to see that STrabble ran without a hitch on my friend's
new TT. The TT screen will be almost IDENTICAL to an artist's impression of
a photograph of an IdentiKit make-up of a side-long glance by a blind
octagenarian wearing sunglasses in the middle of the night at a board game
someone once mentioned while under hypnosis recalling a Scrabble tournament
they played in a previous life. If you get my drift.

Ciao!

This looks like a corupted Database (I once mangeld with this and got the
same reslut)
>Also, I think `DongleWare' is a bit beyond the realms of what I'd like to
>see at atari.archive. After downloading 450K at 2400 baud I was, to be blunt,

Anyway you can ONLY play till Level 10 on Level 11 there are special
Pieces in your Way which need to be removed by a keysequence, which itself
can only be retrieved from the above mentioned book. (I think the company
called it dongleware.)

I'm a little confused by your last statement. What makes Uniterm so good? I have it, but I have had several problems getting it to do the following things:

1. ANSI (with graphic characters) emulation.

2. Dialing properly. It seems that when I tell it to dial, it will dial once, and then WAIT until I press a key to dial again. This seems strange, since redialingis used mainly so that you don't have to hover over the keyboard.

Interlink does do ANSI emulation, and the dialer is simple. Everyone says UniTerm is good, but *WHY*? (Surely not because it does Kermit? There is an external Kermit utility in the public domain, which could be used just as easily.)

Also, what is the latest version? I've been using 2.0e, which is the newest I've seen or heard about.

For anyone else looking at the ST GNU suite, ++jrb has kindly agreed to mail a cart tape with his GNU suite to A.A. There are rather too many mismatches at the moment for me to sort out the archive properly. ++jrb is working on an update at the moment, so it might be worth hanging fire a wee while.

You need to reset the dialer timeout delay. It's on the Dialer menu. That
should speed things up for you.

Uniterm is good mainly because it does almost every kind of terminal
emulation you can think of. It also has (imho) a very good kermit
implementation too. Maybe you don't have the docs that come along with
it? btw 2.0e is the latest version

Well, I think UniTerm is better than Interlink in the same manner that I think unix is better than TOS...one is a lot more powerful, but a little unwieldy to use. If you do a lot of communication with mainframes, you will find the features/configurability (is this a word? :)) indispensable. However, if you just want to jump onto your local BBS once in a while to download a file or play nethack, it might not be worth dealing with its little quirks.

BTW, last I heard UniTerm v2.0e edit 14 was the newest version, but I think Howard Chu (was it Howard?) has a version which he updated himself to sort out some of the well-known eccentricities of the program.

Also, UniTerm has the best version of Kermit I have seen on any terminal emulation package for the ST.

Cheers,

Chris

Until I got my TT, I always used UNITERM and found its implementation of KERMIT to be the best of any program I had ever used. But, since UNITERM does not take advantage of my 19" TTM195 monitor, I now use STalker for telecommunications. STalker does not include KERMIT so I use a desk accessory called GEM KERMIT. While GEM KERMIT has a few bugs, such as its FINISH command, it works quite well. GEM KERMIT is PD, anyone want me to post it on the net?

Today I installed a Mega Ste-4 / ATonce-386sx- System.
Windows lookes very nice on it in VGA-Monochrome(hercules not so fine!).
The system had 512Kb-fast-RAM installed.
The only disadvantage is,that you have to scroll the screen up and down
via HELP and UNDO-key. The speed of redrawing the screen is ok,I think.

But the big question is,if you need such a system,if you have a Atari St...

2558. TT disk drive in GCR?

Newsgroup: comp.sys.atari.st
Date: 1991-09-10 18:18:54 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <wcnEmC_00VpOM1Blch@andrew.cmu.edu>
Source record: 229137

A friend of mine with a TT is having problems with the internal floppy drive. It works fine in Tos mode, but fails to read Mac disks while in GCR mode. It also flakes out with the superCharger. Atari claims there is no problem with the TT, and Gadgets claims that most of the time the TT should work, but there are some TT's with problems, which Atari denies. Anybody have any suggestions?

thanks,
mark

>at it.

Since ST programs do not make use of the 68030 MMU, it is really easy to
let the ST emulation run in an area of memory allocated through the MMU.
The only tricky part is controlling hardware access. Obviously, if all
hardware registers are shared between TOS and Unix, chaos would result
from allowing both to access them freely. Therefore the TOS must either
provide new bios routines for the emulation under Unix, or some form
of mutual exclusion and/or value-storage must be performed on groups of
hardware registers.

In practice a combination of these two methods would probably make the
best solution. IMHO there is little point in a machine which can run
either TOS or Unix but not both together. How about it Atari?
Or maybe our German friends will get there first.

Well, Atari also denied that there were problems with DMA chips
on some STe's which resulted in spurious disk errors.

The bottom line is that they very often design products that are
using components that are just barely in spec. When you cut
down your margin of error too much, you get a lot of annoying
problems like this. Why not take the machine in to a service
center (is it still within the 90 day warranty?) and have it
checked out?

Cheers,

Chris

2562. tools for manipulating postscript files

Newsgroup: comp.sys.atari.st
Date: 1991-09-11 00:03:34 UTC
From: peter@geog.ubc.ca
Message-ID: <1991Sep10.170334@geog.ubc.ca>
Source record: 229144

Hello, does anyone know of any tools available which can be used to manipulate postscript figures? What I need to be able to do is read postscript plots and drawings created by a number of other packages, and to move and delete objects, combine images, scale and resize images, and anotate images with text (including greek symbols) and drawing.
The program would have to be able to do this without losing resolution and would need to output another (encapsulated) postscript file which could subsequently be printed.

Something which can run on an Atari ST would be great, but if anyone knows of anything which can do this on other platforms (PC, Sun sparcstation, SGI, Mac) it would be useful to me as well.

I have tried packages on the sparcstation (Island Draw, Xfig and others), but they all had difficulty correctly reading complex postscript plots.

If I am emailed responses, I would be pleased to post a summary.
Thanks.

Hi...
I have a quick question.. My panasonic printer has finally died on me..
I loved the panasonic Kxp1091 but it was slow and noisy.. I'm trying
to decide which printer to buy instead. I've been told that cannons ink jet
printers are as good as/better than HP's.. Considering the fact that I can
get one of the portable Cannons for 350. I'm wondering If I should do it..
does anyone have any info on these printers or can anyone suggest another
printer? I need it for writing papers and desktop publishing. I honestly
feel that in the next year or so my ST will be "gotten rid of " to make way
for an IBM.. so I need the printer to also work with the IBM.. well ... Thanx
alot! Please E-mail me...
Jeremy

Oops! Proper fix overhere is opening your (binary) files with file modes
"rb" and "wb" instead of "r" and "w". This does the ST prevent from
making \n from \r\n.

Jim Allen has posted on GEnie that a second 7406 driver chip,
piggybacked onto the existing one in the TT's disk circuitry has
fixed this problem in many cases he's dealt with. It also appearantly
works with Mega STe's and Mega ST's with problem disk drives.
I don't have a TT or a GCR, and don't know much electronics, but
I'm posting this in hopes that it will help people hwo can make use
of the info, so don't ask me for any details.

Message-ID: <1991Sep11.131201.4616@magnus.acs.ohio-state.edu>
Source record: 229053

I just downloaded the CALAMUS SL DEMO a few days back, and it looks great! It is slightly slower than the original version, but still about twice as fast as PageStream 2.1. It will load and display a .GIF file IN COLOR in about 1/10th. the time PageStream will load and display it in monochrome (I have the ISAC card for color, and both programs seem to work fine in color mode, but PageStream will still not display pictures in color). If this is any indication of how good the release version, then the Atari world is in for a big surprise. The demo version is so crippled that it is hard to see how well some features work (like color seperations, they are disabled). Wouldn't a simple "No Save Feature" demo be sufficient?

Anyway, does anyone know how to get in contact with ISD via Internet? Is it possible? Their GEnie address is ISD, is there anyway to get to GEnie from internet?

Anyone with the original Calamus should get this demo, it will blow your mind. The upgrade cost is rumored to be extremely high, but not nearly as high as buing it new ($1200????).

Atari 520ST, Complete system for serious user.

Hardware: 1 meg memory, color monitor, dual sided
floppy drive, 30 meg harddrive, MIDI, etc.

Langauges: Pascal, Modula-2, LISP, 68K macro assembler.

Tools: Unix, multitasking package, communications package,
VT100 emulator.

Applications: Word processor with real time spell checker,
1-2-3 like spreadsheet with write 90, database, CAD program.

Books & Manuals: 68K programmer's books, TOS BIOS book, system
manuals, applications manuals.

Fun Stuff: Music program, copy protection breaker, two
draw programs, too many games to mention.

works perfectly. Sell whole system or parts.
$950/bo for whole system or trade for motorcycle Peabody MA,
leave msg or call after 6pm, Irene (508) 977-9964

> Jeremy

From what I read in a Magazine a months ago, they quoted DTP Print times
for a range of Printers, the one That was in the List and Not Quoted
was the small Cannon, the main reason was it was far to slow for DTP,
I have seen one running, the print quality was very good, but you need
some hours to print a DTP Page.

Go for a DeskJet 500, there is far better support for this Printer..

2576. Problems with Spectre/Sound/Mega ST - ST is NOT ST ?

Newsgroup: comp.sys.atari.st
Date: 1991-09-11 15:32:31 UTC
From: abulafia@opal.cs.tu-berlin.de
Message-ID: <4787@opal.cs.tu-berlin.de>
Source record: 229052

Perhaps someone has a solution for this problem :

I have a Mega ST and use SPECTRE, but it's very critical for the emulation
to produce any sound. It crashes very often then. First I thought it's just
a problem of the SPECTRE, but I know a lot of friends with ST's and SPECTRE
and they don't have these problems at all.

My question : Has anybody else made the same experience and is it - perhaps -
a problem of some special chips inside the ST. You know, some are faster than
others...

If you have any good information about this, please post or reply.

>of myself now (it's dead easy?). Anyway, does anyone know?

Well, I basically can tell you two ways to do it. From the regular
GEM desktop, you can only SET the name the first time, but it will not
let you relabel it. Thus, that is out of the question.

1) get a program called I believe VOLUME (should be somewhere at
atari.archive.umich.edu). This will let you change the volume
name.

2) use Gemini 1.2 - it's "show info" function allows you to rename
the disk from there - you just single-click on the disk icon,
click on "show info" and change it...

Hope this helps...

2578. Help: MiNT and remote logins.

Newsgroup: comp.sys.atari.st
Date: 1991-09-11 16:45:28 UTC
From: jmack@b11.ingr.com
Message-ID: <1991Sep11.164528.1618@b11.ingr.com>
Source record: 229058

In response to a previous message of mine, several people
suggested that I try MiNT. After looking at it for a couple of days it
seems like I should stick with it. (Thanks for the responses.)
What I ultimately would like to do, is be able to remote login
(via modem) to a shell running on the ST. This would allow me to do
file transfers without messing with setting up my own BBS. Is there a
quick and dirty way of doing this by redirecting I/O for the shell?
Also, what shells would allow me to do this? Is the MiNT 'kernel'
suitable for this?
Many thanks in advance for any help.

>rosenkra@convex.com

Recently I used the original sources to the pbmplus package and rebuilt them with gcc 1.40 on the ST. There is a flag in pbmplus.h (if memory serves) that specifies whether the different pbm programs create binary files, as the ones currently on the umich archive do, or whether they create files with textual representation of the data. Since I had the same problem with the versions on atari umich that you had, I built the programs with the flag set to create numeric text data.

These programs worked, but using textual data files has a couple of (minorly) undesirable effects. First, depending on the resolution of the images you're working with, the data files can become monstrously huge. For example, a 640 x 400 color ppm image took up about 2.3M on my hard drive. Also, the larger file size, in combination with the fact that the programs have to translate between binary and alphanumeric representations also make processing slower.

There are a couple of reasons that I have not posted the versions I built. First, and foremost, I am not sure which programs actually work. Pbmplus is a large package that supports many image formats, most of which I really couldn't care less about, and I don't have the time or inclination to test and maintain them. At least one program that I built does not work correctly (either qrttoppm or ppmquant; maybe ppmtogif, but I doubt it as I giftoppm'ed an image, and then converted it back and that worked).

The other reason is that the pbmplus sources I have don't include any of the spectrum file processors (ppmtospc, ppmtospu, spctoppm, sputoppm), and I want to include at least the spu converters, so I'm going to have to use the ppm library functions to write them myself. Again, limited time comes into play here.

The only reason I really want the package for is its qrt converter, and until I can get qrt itself correctly ported, I won't be working much on pbmplus. (As an aside, qrt is really beginning to bug me; I've gotten it to correctly build on every other platform I've tried EXCEPT the ST. I finally found a version that someone ported on the Codehead BBS, but it was apparently written in Laser C, and it blows my Micro RTX kernel into tiny smithereenies. ARGH! As far as I'm concerned, if I can't background something that takes that long to run, it's useless. However, if others are interested, I will post the Laser C port to umich.).

If you've made it through this much of my loquacity, let me just say that aside from the makefiles, everything else in the pbmplus package pretty much built as-is with gcc, so if someone with a greater interest in the variety of formats wants to support it, it PROBABLY only requires minor fixes here and there; the trick is finding the trouble spots (if indeed the programs actually do not work).

Comments and questions are welcomed.

There are several external protocol programs that can be used along
with Flash. Kermit and Zmodem are both available and take almost no
effort to install on a Flash function key.

[Roger.Sheppard@actrix.gen.nz (Roger Sheppard) wrote ...]

> Antic use to advertise a Kermit Option for Flash, but I don't know
> if its posible to still get it ..

Some dealers may still have it, but you probably would only be able to
find it as a used program someone didn't need anymore. It was an ACC
that supported kermit and gave Flash the ability to act as a limited
small personal bbs.

Unfortunately it doesn't work with the most recient version of Flash
(it's an -old- accessory) and the improvements in Flash since it was
compatable with the accessory are important enough that I doubt you'd
want to go back to that version.

2588. New upload to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-09-12 00:14:32 UTC
From: dodgson@sol.cs.wmich.edu
Message-ID: <1991Sep12.001432.8765@sol.cs.wmich.edu>
Source record: 229063

This is the doc file to a program I just ftp'ed to atari.archive. I
hope you find it as useful as I do.

```
-----------------------------------------
Deluxe Rename program

written by Harry Dodgson with the
assistance of Mark O'Bryan for some
of the GEMDOS calls.
Copyright 1991, Harry Dodgson.

see bottom for distribution notice
-----------------------------------------

I wrote this program to rename groups of files
and to move them from place to place on my hard drive.
I wrote it in True Basic so it is a pretty large binary
program. There is no sigificant error handling in my
code, but it is robust anyway. Everything runs from
menu bars and dialogs. The status window is not
graceful or polished, just usable.

To use it, select the options from the menu bar
to get the file selector box for both the source and
destination directories/names. I have set it up to
work with both the TOS 1.4 file selector or the LGS
prompt syntax. There is also a menu option to arrange
the input file characters into a different order than
they started in.

As an example, you can rename a group of files
named: D:\INCOMING\DIG01TXT.ATA - DIG35TXT.ATA
into D:\SAVE\DIGEST01.UM - DIGEST35.UM
very easily.

When you choose "Set Old" from the menu bar, you
will get the file selector and can choose the path
specifier and file types, both ? and * being allowed.
The status window will list the files selected. You can
optionally choose "Set Shuffle" to rearrange the order
of characters. Then you choose "Set New" to choose the
destination for the files. When you select "Rename" from
the menu bar you are shown the list of files in the
status window and are allowed to cancel the current
operation. If you choose to continue, then the stus
window will show each file as it is being renamed.
```

If you don't type in anything for the filenames in the source file selector, it will assume you want the entire directory contents. If you don't select a shuffle pattern it will leave the characters in the same order they started in. If you leave the destination filename blank, it will assume that you don't want to force any characters into the destination filename.

To perform the example, you would select the directory D:\INCOMING and use DIG??TXT.ATA as the source specifier. Then set shuffle as 12300045.000 . Lastly set the destination specifier for D:\SAVE and DIGEST*.UM . Notice that I use 0s as place holders for don't care entries in the shuffle specifier. The program will properly expand and compress the filenames so that there are not any invalid characters embedded in the filename. It also doesn't really matter what order you set things in. You can choose destination, shuffle, source if you wish.

This is a shareware program. If you like it, send me what you think it is worth (say $5.00). If you don't like it, send email to dodgson@coyote.cs.wmich.edu with constructive criticism so I can improve it.

> receiving AC_CLOSE. But don't forget to Mfree() it - on the other hand,
> you must also assume, that it is not gone. You'll never know... :-(

Mfree'ing memory after an AC_CLOSE is a bad idea... If the AC_CLOSE
is triggered by an appl_exit() call and the program returns to a non-AES
shell program, the user may run dozens of non-AES programs before the
ACC is able to fully process the AC_CLOSE message. Since the main
application may -or- may-not exit after making an appl_exit() call,
there's no way to know if the accessory should assume the memory has
been freeed by the application exiting or not. This is the cornerstone
of why using the gemdos Malloc() in an accessory is, in general, ABI
(A_Bad_Idea).

Better to assume it has been free'ed, and take the risk that those
memory blocks are temprarily lost (until the application really does
terminate), than to free memory that the system may already have
assigned to someone else.

I think it would be better to say for accessories:

-- Don't use the gemdos Malloc() for allocating memory after your
first AES call (probably appl_init()). Any memory allocated
before the first AES call will remain assigned to the accessory
and should not normaly be Mfree'ed. On the other hand, if you're
going to need a large fixed-size block of memory, it's better to
modify the accessory to reserve that much more memory as part of
your BSS (uninitialized dataspace) rather than using Malloc.

-- If you absolutely must use Malloc(), you probably should rethink
what you're doing. (Example: Small scale allocation can be done
safely using variations on the standard malloc()/free() routines
to/from a large block of memory Malloc'ed before the first AES
call. This can be done with a small change to almost any standard
C or asm library..)

-- If you choose to ignore the previous two warnings, when your ACC
receives a AC_CLOSE message, assume any memory Malloc'ed since the
prior AC_OPEN has already been assigned to someone else for the

last 20 minutes...

-- Consiquently, it's a bad idea to call Mfree() to free memory after
you've received the AC_CLOSE message... You might be "freeing"
memory somebody else is already using.

-- Generaly speaking, Malloc() is only "safe" within an accessory:

1) Before the first AES call.

or

2) Between any two AES calls, and you must Mfree it before the
2nd AES call. (And even this may have problems under some
TOS multitasking extensions...)

-- Yes, there are exceptions and tricks that allow allocating memory
at any time, but they require knowledge of TOS internals, and
should only be used as a last resort and then only by experts.

Subnote: Atari -could- document these tricks and announce them to
the world (they have ocassionly leaked "hints" about how this can
be done burried in various technical responses). I'm not sure,
but I suspect they are reluctant to document and release these
techniques because it could easily create a flury of new and
poorly designed accessories that would fragment memory and make it
difficult to maintain the current Malloc-cation subsystem. A
complete redesign of the memory system would take a lot of work.
(I suspect it's somewhere far down twords the bottom of their list
of "Things to be done - someday"...

Well, it seems you haven't seen Uniterm as yet.

Seriously... I tried Rufus, but it bombed out a couple of times, plus I don't have a blitter, so the display is rather slow (if you still want 80x24). Does Rufus support a macro control language anything like that of Uniterm? When I login to uni, it is a one button affair (excluding password input). And it is a fairly complex login.

Yeah, I have Unix in a Desk Accessory. It even runs X-windows, giving a maximum resolution of 1280x960 in Low res, and 2560x1920 in high res. It uses special encoding techniques to cram 200 Megabytes onto a 30 Meg harddrive, and a special adaptor that allows the ST to be hooked up to a LAN via the printer port, which Atari so cleverly made bidirectional.

In a million years.

> suitable for this?

There are some problems with doing this the quick and dirty way. What
happens if your modem fails? What happens if some pimple-faced teen-age
zombie hacker gets into your system? These problems aren't hard to solve;
you could write a little login program and a safe shell-around-the-shell
in about 45 minutes. Just be sure to keep an eye on the modem's CD line and
-- if you really want to be safe -- the clock. The remote shell can then
pass commands to a conventional shell via the library system() call. That
way you get the shell's power with a BBS's safety.

Source record: 229067

I am using Rufus with Matrix C32 and it works nice (I have version 1.06
of Rufus but also 1.02 worked). Rufus is quite clean program.

By the way I have in contact with the author and hes just preparing
version 1.1 of Rufus. I will have really working VT100 emulation.
And other nice things, so it is about a time to register.

I downloaded OXYD from a.a, and it works fine (on danish TOS1.4). A freind of
mine with a english TOS1.2, can't run it though. It also works fine on a german
TOS1.??.
I don't know what the problem is though. But I can run it from harddisc,
with accs and auto programs active.

Source record: 229080

I recently purchased a 50 meg hardrive and a monochrome monitor for my 1040 st. The st was bought around 1987 and is the original machine, no TOS updates, memory upgrade etc. It has alway worked fine with my color monitor. Now that I've got the hard drive and the mono I have the following problem. Whenever I copy file from A to the hard drive the monitor freaks out and just scrolls and has snow. If I reboot the system the problem goes away. Also I ran another program and the desktop came back shifted and part it was backwards?(It hard to explain what it looked like) The guy I bought it from suggested that maybe I need a TOS update? Can anyone help me. How can I troubleshoot the problem?
Thanks
Gary

Well, I started using Rufus, and I liked it a lot, except that sometimes
the VAX I connected would send out a code that would reset the keypad to
NUMERIC and that I would have to set number of columns to 81 so that 80
col lines would be doubled spaced.

Is there a newer program out?

(Note: I posted a similar reponse a couple of days ago, but our
newsreader crashed and it apparently did not get sent out
(as far as I know). If this is a duplicate, I apologize
in advance.)

There is a public domain version of Kermit for GEM available (which I
obtained from GEnie). With Flash 1.6, all you need to do is to tap
INSERT to get a command line prompt and then type: GEM pathtoKermit
(return). This will shell out of Flash into Kermit. When you quit
Kermit, an additional key press (any key) is prompted which returns
you to Flash. Very easy and convenient. To make it even nicer, you
can edit the function key table to assign the above string to a
function key. Then, Kermit (or any other protocol) is available with
a single key press. Really great stuff!

BTW, this is a generic "execute" mechanism as someone else pointed out.
In addition to the generic version, there is a command which allows
you to shell to your favorite editor.

Source record: 229087

A couple of weeks ago I was tying to UUENCODE a text file on our VAX
and then UUDECODE it. When it was decoded the EOL was saved as whatever unix
uses so my decoded file
looked
like
this.

Well someone sent me another version of UU**CODE sources for the VAX
and when I tryed them the file now
looked
like
this.
which is what I had started out with. Correct?, yes. Better?, no. You see,
now when I try to decode a large UUENCODEd file into an archive of a GIF only
now when I try to decode a large UUENCODEd file into an archive of a GIF only
the first part of the file is done correctly. I'd rather be able to decode
on the vax so that I am transferring the smallest possible file (ARC, LZH, GIF,
etc.) over the modem to the my ST.

Now to the reason I'm writing all this. I'd like to use my old
UUDECODE routine but I COPIED OVER IT WHEN I GOT THE NEW ONE. I don't know
who wrote the old one but the source was set up to be compiled under UNIX c,
VAX c, MS-DOS, and GEMDOS. If someone has this source code could they mail
it to me. I've already looked through the source section of the archive and
didn't find it. Also, I can't FTP off site so sending me addresses wont help.

Thanks,
Bion

the first part of the file is done correctly. I'd rather be able to decode on the vax so
that I am reansfering the smallest possible file (ARC, LZH, GIF, etc.)

2608. .TGA (Targa) Picture on a ST?

Perhaps you have a Virus, since that is not normal behaviour for an ST.
At least I've never heard of anything like that happening. Before you
upgrade, get a good virus locator and check all your disks. If you don't
have a Virus, I'm not sure what is wrong. I hope this helps you out a
little.

Source record: 229093

Well, Bobie boy, you're almost right. Certainly an IBM emulator on
an Atari is not going to be 100% compatible, but neither would an
XT system. More and more software companies are finally getting
the picture and beginning to write software that will only run on 386
systems. OS/2 version 2.0 is one example. QEMM 386 is another.
These packages will not run on an XT. Sure there's software out there
right now, but the days of the 8088/86 chips are certainly numbered.
If someone has an ST system with a color monitor and a harddisk
already, all it would cost them to get the original SuperCharger
is $400. This would be a system that was pretty darned compatible,
had color graphics and a harddisk. To get the same kind of price
for a comparable "IBM compatible", either you would have to buy
used equipment, or sell your Atari. With the first option you
end up with two computers, and the second you end up with only one.
I'd take the first option any day. Now if someone has your basic
monochrome ST system with just a floppy disk, they'd be better off
going out and buying a real "IBM compatible", instead of purchasing
something like SuperCharger. The IBM emulators are designed to be
attractive to Atari users who already have everything they need
except an 80x86 chip.

I have bought a portrait monitor for my Mega ST. Unfortunately this monitor does not have a loudspeaker. So my question is:

Does anybody know about a print or a kit for an external audio equipment for the ST.

Many thanks

Georg

It is posible to assign a Printer command string to a Unused screen character,
That is in the Print Driver, then it is posible to get any other
funtion you like.

I'm back on the net. So I can answer this question.

As I stated before:

This 386 emulator ONLY ONLY ONLY works with a MEGA STE.

And I noticed nothing about scrolling the screen up and down during
the demo I got!

The program you need is called UNITERM - I have V2.0c and find it's
VT100 emulation excellent. It even does the graphics, double-height
characters and application keypad.

You should find it in any decent PD/Shareware library.

Help Needed with Silver Reed EXP400

I have an EXP400 Daisy Wheel printer which I'd
like to be able to drive from any reasonable pd
word processor.

I have ST writer elite (3.0) but no suitable
driver. Also I don't have the manual for the printer
or I could modify an existing driver.

Can anyone out ther help ? with either a driver (config.txt)
for ST Writer or with advice on other pd software I could use.

Thanks
David.

I don't agree with you. Here in NY, you can buy an XT laptop
with 640K RAM and 2 floppies for $399 and for about $300 more
you can get a 286 laptop with a hardrive. If I had any real
need to use a MS-DOS machine I would probably opt to buy one
of these machines rather than deal with all the hassles of putting
one of these "sorta compatible" boards in an ST. The cost is
almost the same so why bother hacking up your ST?

2625. gcc and gxx (gnu)

Newsgroup: comp.sys.atari.st
Date: 1991-09-13 13:29:20 UTC
From: arshad@siesoft.co.uk
Message-ID: <1991Sep13.132920.8524@siesoft.co.uk>
Source record: 228962
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to run gcc & g++ on my atari ST Mega4. I only have a single double sided floppy but there is 4M of memory, part of which I can use as ram disk. My questions are :

1) Is this configuration adequate for gcc and g++ ?
(I know I should have a harddisk but I cant afford it at the moment)

2) Which files beside tos/gcc/bin/gccbin00.zoo I need for gcc from terminator ?
(libraries/includes/docs etc).

3) Is gcc better than Sozobon C ?
(ANSI C).

4) Is g++ a preprocessor or a compiler ?

5) If I get gxxbin.zoo,gxxlib.zoo & gxxinc.zoo, Will I still need gccbin etc? Are there any docs for g++?

6) Will there be a gxxdb (gdb for gcc) for gxx?

Please reply by email (arshad@siesoft.co.uk) and I will post a summary on the net.
Thanks in advance.

> needed to reinstall FOLDRXXX.PRG.

Glad to hear you're running ok, but your previous paragraph implies a
badly incorrect assumption. FOLDERxxx doesn't stop being useful when
you go to versions of TOS above 1.2. I'm not positive, but I'm pretty
sure it can even be used on TOS 3.x machines.

Any time you suddenly start getting wierd disk results after using
your machine for a long time under any version of TOS, you might want to
consider installing FOLDERxxx or upping the number of folders it's set
for (increasing the xxx).

> I am however still puzzled. I've had the Mega-2 for about 6 months with
> no problems, and the 40-folder problem raised its head only after I
> installed Flash 1.6. Someone wrote me that he also had problems after
> installing Flash. Anyone have any ideas about this? Keep in mind that
> the problems I reported arose almost immediately after rebooting,
> whereas previously I could do all kinds of stuff without running into
> difficulty. Does Flash greatly up the folder count?

If you use the "CD" (change directory) Flash command, there's a very
obscure bug you might be running into. If you have any CD commands
where you include both a disk id and a directory, you might try
splitting them up into two calls.

Example:

```
>CD d:\flash\scripts
```

Change to:

```
>CD d:
>CD \flash\scripts
```

Hope this helps....

2628. Internal Drives

Newsgroup: comp.sys.atari.st
Date: 1991-09-13 16:15:05 UTC
From: fox@NAVO.NAVY.MIL
Message-ID: <9109131615.AA14569@pops.navo.navy.mil>
Source record: 228952

[Sorry if this gets posted twice, but we don't have a direct way to post to usenet. I sent this about a week ago and it didn't show up, so try again...]

I would like to add an internal hard drive to my Mega 2, but do not want to interfere with the SLM804. I was in Toad computers a few months ago and asked them about their tadpole internal drives, and the person there said you couldn't use the laser printer with them. First - is that right? I can believe it, since you're reversing the 'normal' order of the laser printer controller and the hard drive in the DMA chain. Does anyone have an internal hard drive which works fine with the laser printer on a mega 2?

Second - does the mega have enough power and/or cooling fan to handle both an internal hard drive *and* a memory upgrade board, like the JRI?

Last - has anyone had problems with the trick of just leaving the laser printer back door open to cut down the noise and heat? I've been doing it that way for close to 2 years now without problems, but then I saw the ads for that 'phantom of the laser' product...

Thanks!

fox@noarl.navy.mil

Well, Chrisie, you weren't reading my append very closely. I'll try to simplify things for you. Let's say that I have an Atari ST with 2.5MB of memory, an 85M harddrive, and a color monitor. For $400 I can buy a SuperCharger (plugs into the DMA port so I don't even have to worry about installing it.) This would give me an XT with 2.5MB of memory, an 85M harddrive and a CGA color. You could not spend $400 and get an XT with 2.5MB of memory, an 85M harddrive and CGA color. As the last line of my append stated, the IBM emulators for the Atari ST are really most attractive to people who already have all the peripherals they'll need on their ST. As far as compatibility goes, there's no reason why SuperCharger should not be as IBM compatible as Tandy computers.

2632. Atari Computer for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-09-13 19:12:58 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Sep13.191258.25744@umbc3.umbc.edu>
Source record: 228963
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

FOR SALE:

Atari 1040 ST
1 meg main system memory
Internal 720K 3.5" disk drive
TOS 1.4 Operating System ROMs
Surreal Systems internal clock chip
Atari SC 1224 Color monitor
Original super-sharp JVC model
Semi-"Home-brew" hard drive
SH 204 case and power supply/fan
ICD Advantage Host Adapter (w/clock)
OMTI SCSI-to-MFM converter
Seagate ST-251 40 meg drive (flakey)
DMA cable
Atari standard mouse
WordPerfect for the Atari ST
Abacus Chartpak
Misc. system disks for the above system
...and any other misc. Atari formatted disks that I have

All this great stuff for just $750 or best offer!

I'd rather sell the system as a whole, but if I get offers
for most of the pieces, then I'll go that way.

Anyway, if you have an offer, then make it! The worst thing
that can happen is that I'll say "No way!"

I prefer email, but if you would rather call, you can reach
me at (301) 521-0015.

Thanks!

2633. Gemini 1.2

Newsgroup: comp.sys.atari.st
Date: 1991-09-13 19:17:59 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <3469@tamsun.TAMU.EDU>
Source record: 228964

When I was asking about Neodesk 3.x I came across a response to use Gemini. The responder said to use Gemini 1.2, but I have not seen it in umich.edu. I decided to use gulam or bash to provide a command line shell for awk and zoo (PCOMMAND converts all paramters to uppercase). Gulam looks very nice, and it has documentation. Bash looks even nicer, but the UNIX tools are not built in and I can't seem to find documentation for it.

Can someone tell me:

- Where is Gemini 1.2 in the atari archive at umich.edu?

- Where is the documentation for bash (I don't mind buying the docs in book form)?

2634. Hard Drive Problems

Newsgroup: comp.sys.atari.st
Date: 1991-09-13 19:29:45 UTC
From: wright@thepond.EBay.Sun.COM
Message-ID: <8293@male.EBay.Sun.COM>
Source record: 228965

Can someone answer a question for me?

I have a 520st with 2 720KB floppies,
I put together a 20MB hard drive - I have a LA PINE Titan LT200 3.5" drive
with a ST506 controller and the Atari I/F card. The power supply I used can
easily handle the current required, so that is not a problem.
The thing is in a nice little package and it works fine...most of the time.

The problem comes up after I have had the system up and running for a while
and the programming I am running has not accessed the drive in a while. When
I do try to access the drive, I get an error that information on drive C could
be dammaged. If I open up one of the other partitions on the drive, or reset
the drive altogether, everything is fine.

I don't save data on the hard drive, so it is only aggravating at times.

Does anyone have any ideas why this is happening??

>CGA color. As the last line of my append stated, the IBM emulators

I would personally rather spend that $400 on a laptop that is
going to be much more compatible that I can put in my briefcase
and use on my business trips.

>for the Atari ST are really most attractive to people who already
>have all the peripherals they'll need on their ST. As far as
>compatibility goes, there's no reason why SuperCharger should not
>be as IBM compatible as Tandy computers.

That is a whole other can of worms. People who spend ridiculous
amounts of money for Tandy's computers deserve what they get... :)

I'm in the middle of writting a Unix type init/getty/login suite for MiNT,
but have suspended development until MiNT 0.9 arrives because of a problem
with terminal I/O from the serial port.

> in... Thanks in advance for any help.....

Some STadel BBS sites have been doing this for years using STadel's (free)
UUCP-related software.

Usenet over UUCP works like this:

UUCP copies two files to the destination machine. One is a data file
containing either a message or a batch of messages. The other is a
command file that is interpreted by a remote-execution facility at the
destination site. The command to process Usenet news is ``rnews.'' The
accompanying message or batch file is processed by rnews and stored,
forwarded, vaporized, or whatever is appropriate.

I'm not aware of any software to convert Usenet messages to whatever
proprietary format Express uses. If you want to write your own
rnews-equivalent, you can start with the Internet RFC documents that
describe the standard format of Usenet news messages. The format is fairly
simple and involves only plain text. (The Express side you'll have to
figure out for yourself.)

Internet RFCs are available by anonymous FTP from nic.ddn.mil or by
email from various mail servers; I think the last time I fetched such
data, I got it from info@sh.cs.net. Try sending a message containing the
word ``help.''

>does somebody know an email adress of the Mark Williams Co. in Chicago
>especially for C Compiler Support, new ST products?
>
Mark Williams is no longer in the ST Compiler biz (from a phone
conversation with their tech support guy about 9 months ago). They were
looking for someone to upgrade their compiler to Ansi-C, but
they admitted this wasn't a very active search. They are making a nice
living on their Unix-shell(?) and other compiler products, but they were
never excited by the numbers from their ST markets. However, if you
need a non-ANSI compiler that produces codes least likely to break on a
generic Unix compiler, Mark Williams C still fits the bill. However,
if you're producing commmercial ST products.....

Ooooh! Chrisie called me a weenie. I'm gonna tell! Lighten up Chrisie. Your posts have insinuated that NOONE would get any use out of an IBM emulator for the Atari. I've merely been disagreeing with you. Sure, some people want more than a 286 with 2.5Meg of memory and 600x200 color graphics. However, there are people out there who are perfectly happy with their Atari, who just want a little freedom to run an IBM program occasionally. Compatibility is a relative matter. If what I want to run works on the IBM emulator then I consider it IBM compatible. What works on SuperCharger? Lots of stuff. DOS 3.3, DOS 5.0. dBase, Lotus, WordPerfect... The list goes on. I work with IBM equipment, and people using IBM equipment everyday. My experience indicates that 99% of the software that gets used on the IBM in an academic office environment will work on SuperCharger. You keep making claims about how an XT would be more compatible. Who cares if it's more compatible if the things you want to run work on SuperCharger?

2640. Cable from STM to composite monitor

Newsgroup: comp.sys.atari.st
Date: 1991-09-14 00:22:57 UTC
From: stever@flatcat.wpd.sgi.com
Message-ID: <1991Sep14.002257.9952@odin.corp.sgi.com>
Source record: 228971

Actually, my monitor is an amber monitor that I used to use with an Atari 800.
I'm looking for a way to connect it to a spare ST to make it useful for my girlfriend.
Anyone know where I can get a cable that pulls out the composite output from an ST's
monitor port? I realize that this will only work in color resolutions and that I'll only
get grayshades. Also, is there a problem with plugging composite output into a monochrome
monitor (it's not TTL, in case you're worried :-)

Thanks,

You could also use the Mercury UUCP distrbuted last year on
comp.sources.a.st. The easiest way would probably be to set the
uucp up as a daily process if you can do that with express. Then
have the users able to call rn as a door program, or whatever
express calls external programs. With the source code for rn,
you could probably redirect it to the modem without much trouble.
Elm could probably also work in this way.
Trying to convert the RFC type messages to express type, then
back again would no be a good idea, as the potential for message
mangling is very high.

Just to throw in my thoughts on the subject, there are some uses for emulators. While yes you will not have certain features as actual IBMs/clones, the question is will you need it or want it? I just got a ATSpeedC16 because I basically want to be able to run programs for school and maybe some business stuff (such as Lotus, etc). I figure a 286 and EGA/VGA graphics should last me for quite a few years. Besides, I'm at 2.5 megs (soon to be 4 megs) and am not worried about lack of compatibility.

Why don't I get a pure IBM then? If I did, why should I keep my ST? (two full-sized systems are more than ridiculous for me when BOTH do what I want them to do, and I like the ST better - just want to have the IBM compatibility for those type of programs that aren't available for the ST yet)...

Mark Williams C v3.0.9 - includes mater disks and 828 page manual/refernce guide. $100 US

Michtron Hyperfont - outline based GDOS font development system. Original disks and manual. $40US

Neocept FONTZ - GEM font editor. original disks and manual. $20US

Prices negotiable. email or call 519 742 0370

Brett Maraldo

ps. Also, I am distributing a very well organized and documented TeX/Metafont distribution. It included:

- the latest version of TeX and Metafont
- LaTeX, MuTeX (Music typestting)
- Wasy (nifty fonts)
- associated files
- a pd dvi viewer
- full set of organized fonts
- Gentle Introduction to TeX by: Michael Doob
- optional TeX Book, Metafont Book, and LaTex manuals (extra charge)

The set is on floppies and is fully unarchived and organized into folders with installation manuals describing various set-ups and required files. The distribution is variable in price depending on your needs (full system? all the fonts? etc). Contact me for details:

You using your Daddy's account again Kevie..? Grow up a little
and realize that cutsie personal attacks don't get you much
respect...

>You keep making claims about how an XT would be
>more compatible. Who cares if it's more compatible if the things
>you want to run work on SuperCharger?

Until the day you download an application you want to run, and
it won't run on an "emulator"...

Obviously QEMM386 won't run on an 8088 XT...it's *designed* for
a '386, just as a TT program won't run on an ST..

The point is, why spend an almost equivalent amount of money on
an "emulator" that might run *some* of the applications you want,
when the "real thing" costs about the same...?

Why limit yourself to the restrictive features of the "emulator"
when you can easily add VGA graphics, High Density disk drives,
and all the peripheral devices that just plug into the XT buss
in a "true" XT...?

An upgrade from an XT to an AT involves swapping out the
motherboard for a cost of about $79... how much would it cost
to upgrade a SuperCharger to an AT...?

The ONLY reasonable argument I've heard for using an emulator on
an ST is not having the physical space for two different complete
computer systems. Cost and capability are NOT good arguments for
going with an emulator...

There will be e new version of Rufus in a few week. Michael Bernards just announced it on Mausnet. It is completely rewritten, has a complex dialer, full TT support (f.ex. for the additional serial ports) about 100 macro language commands. You will hear about, when it's available.

Bye......Michael

>
First of all, you should get TOS 1.04 and throw away your old TOS. Then
check out your version of Rufus to have 1.06 on your disks. Also, check
your GDOS. You say, you run "normal GDOS", do you mean that one from ATARI
or do you have AMCGDOS ? You should use AMCGDOS in Version 3.2 to run on
your ST. A friend of mine uses Rufus without GDOS, because he uses DAVI
as monitor driver, which doesn't allow GDOS to be installed.

The demo only supports single sided discs. So you only have to try your version
on a double sided one. If it works, it's no demo, otherwise you have the demo
version.

Whoa there!! Is there a newer version of Flash that 1.6!!?! I heard a
rumor about a 2.0 release, but have not seen any ads for it. I like
Flash a lot, and would be very interested in a new release (I hope they
fixed the "no underline with TurboST" bug). I have Flash 1.6, the latest
version that I know of, and it works fine with the Kermit acc.

Heehee, after my success with Little Computer People, I thought I might as well ask.

I have read about Trip-a-Tron in british magazines, and here on the net. It looks like something I would be into owning. Unfortunetely I have been unable to locate a copy stateside (I made the rounds of the 1-800 numbers).

Does anyone have a copy for sale? Does anyone know where to purchase a copy in the states? Any brits want to try to mail it to me (for suitable bucks, of course)?

For those that are not familiar with the product, it is a graphic demo creator type program. It was written by the same guy that did Llammatron. The graphics are incredible. Also, if any 8-biters are familiar with Colorspace, this is sub-titled Colorspace II. This description does not do the program justice, but I am unsure as to just how to describe it. It is very unique.

If you have an ICD controller in your hard disk, I have a great idea as to what the problem is. ICD recently went to a newer snazzier DMA cable (hooks the hard disk to the computer) that says ICD on it. Unfortunetely it also has this problem on SOME ST's (not all). You should be able to tell if you have an ICD from the boot info that scrolls by at bootup. To fix it, you merely need to call ICD. They will send you a new cable for free.

I suggest you get a copy of ST-Writer Elite. It is somewhat GEM based,
and many folks prefer it over any other ST wp (I am not personally one
of them, but it is a fine piece of work). It is PD, and is available in
several languages. It is loosely based on the old Atariwriter word processor
for the 8-bits, but is of course much nicer. I have a copy because I
occasionally run into a doc file that was made by it (it also pays to have
a copy of 1st Word for the same reason). It is available from several
places (including atari.archive), but I recommend that you buy it from the
Current Notes PD library. The reason for this is that when a new version
comes out, you can send the disk in and get it updated for free (this is the
only PD library that I know of that offers this service). My views on the
magazine are legendary on this group, so I won't go through that spiel (just
get a subscription!!).

Oh, I seem to remember that this program is also available in a huge text
visually impaired version. Kind of neat.

2658. Why is fscanf function of Mark Williams "C" so slow?

Newsgroup: comp.sys.atari.st
Date: 1991-09-14 17:59:45 UTC
From: wabe@ukc.ac.uk
Message-ID: <419@hobby.ukc.ac.uk>
Source record: 228985

I have noticed that if I compile anything with MWC which involves reading floating point numbers from a file - using their fscanf() function - (by the way I last updated to Version 3.0.6 of MWC). Identical code compiled with Sozobon's fscanf() runs about 10 times faster. Unfortunately although I have Sozobon's sourcecodes I cannot incorporate their fscanf into my MWC library "libc.a" - since Sozobon's fscanf() is not "self-contained" i.e. calls many more primitive subroutines. Also Mark Williams' "doubles" are genuine 8-byte wheras Sozobon's are same as "floats" i.e. 4 bytes - but this CANNOT explain the ENORMOUS difference in speed I experience.

I have not heard anyone else mention this - Have I got a few bits wrong in my MWC library file "libc.a" or should I be setting some buffer to a higher value (I cannot see any reference to any such buffer in my MWC manual which, admittedly, is only Version 2.something - as I upgraded) or am I not doing something else???

For virtually all else MWC's performance is par excellence.

Any hints gratefully received, W. Alan B. Evans
[wabe@ukc.ac.uk]

Well, for some time hard disks on ST's were very rare. The ST system was basically floppy based for several years. This resulted in a lot of software which has "a:\...." in it (ie hardcoded to work only from the floppys). Other factors which might affect this are copy protection (physical copy protection can only be done on floppies, and are thus restricted to them) and also "demoes" which are crippled to only run from the floppy (to encourage users to purchase the uncrippled version). Most commercial games will not work on a hard disk. This is because 99% of ST game purchasers do not have a hard disk, and game programmers know this (and it is easier to say a: than to look up the current logical drive from the os). As a final note, some programs have config files which are initially set for a floppy based system (again because that is most of them), but can be changed for a hard disk based system. I seem to remember that Personal Pascal was like that; You had to go in an edit a text file before it was able to find anything.

I have dealt with this problem many many times (since purchasing my hard disk). Please feel free to email some details, perhaps I have encountered this particular program.

You haven't quite covered everything Bob. I assume your making all
these criticisms about any emulator, emulators in general.

What you say about cost saving just isn't true with a Spectre GCR.

You get much better performance than an Classic System, lots more memory,
in my case twice the speed, I own a MEGA STE. Far lower price too.

I also think that given the type of systems we are comparing, Apple system
software vs. Atari crud called TOS, the benefits go way beyond savings

on the dollar.

I don't even think I have to go into detail here, anybody with any common sense at all, or is on a budget, knows what I am talking about.

> 1) Is this configuration adequate for gcc and g++ ?
> (I know I should have a harddisk but I cant afford it at the moment)

It may be adequate for gcc, but probably not for g++. I think g++ takes a minimum of 2 Meg. of memory, so at least it would be a tight fit in which you couldn't compile any 'serious' programs. The 4 Meg. would be enough to run both comfortably if you had them on a hard drive.

>
> 2) Which files beside tos/gcc/bin/gccbin00.zoo I need for gcc
> from terminator ?
> (libraries/includes/docs etc).

You will also need the library from tos/lib/bin and the includes from tos/include/bin.

>
> 3) Is gcc better than Sozobon C ?
> (ANSI C).

gcc is ANSI C and Sozobon is not, so gcc is 'better' if that's what you mean by better. I think the optimization is better in gcc as well, but on the down side, gcc takes up more memory (see above!).

>
> 4) Is g++ a preprocessor or a compiler ?

It's a full-blown compiler which uses a lot of code from gcc. I think starting with version 2.xx, gcc and g++ will be integrated into one compiler.

>
> 5) If I get gxxbin.zoo,gxxlib.zoo & gxxinc.zoo, Will I still
> need gccbin etc? Are there any docs for g++?

Yes. No documentation that I know of, execpt that g++ tries to be faithful to the standard C++ from AT&T.

2663. Gplot

Newsgroup: comp.sys.atari.st
Date: 1991-09-15 01:15:37 UTC
From: dcrevier@jarthur.claremont.edu
Message-ID: <1991Sep15.011537.26486@jarthur.claremont.edu>
Source record: 228994

At the beginning of the summer I attempted to send a program called gplot to atari.archive.umich.edu, but the file got messed up somewhere, and I was gone all summer, but I have sent a new copy of the program to atari.archive.umich.edu, and I think it should work alright now. Below is the message I originally posted about the program.

I have sent a scientific graphing program to atari.archive in the file GPLOT.ARC. It is something that my father and I worked on for the last couple of years. I am a student at Harvey Mudd College, and have used it for many labs and homework assignments. My father is a physicist and has used it for many reports and briefings. We were planning to try to sell it commercially, but have decided to release it as shareware instead since we haven't had any luck finding someone to sell it, and it isn't completely bug free. It is very good for scientific graphing. It will graph sets of x-y data, functions, and differential equations. It has a powerful spreadsheet type editor for entering and manipulating data. It uses GDOS, so the graphs are printed at very high resolution to the printer and look very good. It will work on both color and monochrome monitors. I know that it works with 1040's and Mega's, but it may not work with a TT or a moniterm monitor. Also, I think it needs 1 meg (someone please post once they have tested it). The included documentation is not as thourough as I would like it to be, but it talks about all of the features of the program. It has no information about setting up GDOS. We are asking for a $15 shareware fee. Please distribute this program as much as possible, and send any comments to:

dcrevier@jarthur.claremont.edu

>
>Carsten
>

I don't know about anyone else... but it seems to me that Atari better
start working on another graphics resolution... and I'm not talking for the
mucho expensive TT/030 either.

I wonder what it would take to bring back the STs popularity in the UK
and other parts of Europe as it once was four years ago?

Incredible graphics?
Several sound channels?
Built-in gaming hardware?
Multi-media built in (sorta like Quick-Time for the Mac)?
Mediocre multi-tasking like on the Amiga?
IBM compatibility?
Easier expandability to keep up with newer computers?
Perhaps a new NAME?

I know what Atari needs in the U.S.... FIRST - new management.
SECOND - newer computers.
THIRD - fantastic marketing.

You're absolutely right. Had I correctly typed "NON-PROPORTIONAL" fonts,
it might have been more helpful. My apologies to all, and thanks to you
for pointing it out.

Non-proportional fonts (each character having the same width) are, in fact,
the only fonts which GEMINI can use; just as you've pointed out here and as
I had intended to. Sorry for any confusion. :-(

You mention only "lack of physical space" as a good reason for getting an emulator. For me it's basically a luxury - everything I really need in a computer I find on my ST, and my IBM emulator is merely for the luxury to run some IBM stuff if I want (and most of the important utilities/applications such as Word Perfect, Windows, DBASE, etc should work -- and that's all I really worry about). When I finally get a high-paying job I will probably get a pure 286LAPTOP (VGA of course), but for now why would I need it?

No, Bobie, I'm not using my daddy's account. My father has been
dead for 18 years. Before you put your other foot in your mouth,
I'm not using my mother's account either. She's been dead for
15 years.

You, like Chrisie, have not been understanding what you've been
reading. You do read, don't you? Once again, I'll try to
simplify things for you. If someone has a couple of thousand
dollars wrapped up in Atari hardware and software, and they want
to run some IBM software, it's going to be much less expensive
for them if they simply buy and IBM emulator. If they buy an
IBM compatible, then they have to buy all of the goodies to go
with it including software. Go to college Bobie. Take some
economics courses. One day you too will be able to understand
simple economics.

If I have misunderstood your poorly stated arguements, and what
you have really been meaning to say was that if you want to
run mainly IBM software, then you should buy an IBM or compatible,
then I couldn't agree with you more. However, if you are
perfectly happy with your Atari, and you want to run some IBM
software, then an IBM emulator can be the most cost effective
way to go.

Gregory Carter make some good points about the Mac emulators...

Yes, in the case of the high priced Mac systems, emulating them with an ST makes more sense... but the emulation is still not "perfect"...

The ST Mac emulators do go a lot farther toward full emulation of the "target" systems than the IBM emulators do... that's true..

In this situation, where you don't much care whether an IBM
application runs or not, there isn't much reason to worry about
it...

The first time a program tells you that your video mode is
insufficient though, you may have second thoughts...

are so juvenile that I doubt anyone really hears him...

Maybe when he grows up a little someone will listen to him...

Meanwhile, there are legitimate reasons to use an emulator on
an ST, but it still remains that anyone who really needs IBM
compatiblity is better off using a true IBM compatible system.

BobR

RJ> Okay, you are saying that Gemini can only use Monospaced fonts.
RJ>Now how can I tell the difference...

Look into the file with a disk monitor. If the third bit of Byte 67 (or Byte 66, if Intel format) is set to 1, the font is monospaced.
Or try to get a font editor, it will show the information you need.
Or at least, if Gemini accepts it, it is monospaced ;-).

I'd have to agree... Though I'm sure you could get by with a Supercharger for most of the stuff you'd _need_ to be doing on a PC... Things most people _don't_ need to do (like looking at 640x480x256 colour GIFs) but do anyway will require a better graphics mode. Unless you're getting into wild image processing and CAD work, VGA or so graphics are pretty under-utilised on PCs... And Windows is a major CPU/Memory pig...

Trying to use something like pc-ditto would be completely absurd... The problem: speed. pc-ditto aches along at something like .3 Mhz (if I remember my cpumhz.com response)... Last year I did some major SQL database work in one of my courses, and tried doing it at home... Nothing like waiting 6 hours for a moderately complex query to come back. Needless to say, I went to my labs after that.

For the record: I despise PCs. I used a 20Mhz '386 for the past 8 months and Windows redrew the screen slower than my old 8Mhz ST does... And there's no way an operating system should suck back memory that badly.

2673. More Lies From Atari?

More Of The Same?

I am really disgusted with Atari's dismal marketing of the Atari ST/TT computers here in the USA. So much so that I just don't believe anything that Atari promises any longer. I am including a copy of an early ZNET magazine describing the recent Atari show held on Saturday Sept 14 and Sunday Sept 15 in Glendale, CA USA. Glendale is a suburb of Los Angeles, CA, still one of the largest cities in the USA.

Does anyone believe any of this from Atari? I don't for sure!!

```

=====(( ======= ........................................
==((((((((((  == .....September 14, 1991...................
```

Edited by Ron Kovacs
Reported by John Nagy

This is a transcript of a live GEnie ST RT conference where John Nagy reported on the first day happenings at the Glendale Atarifest in California.

The show had better attendance then was expected and vendors are sorry they didn't bring more to the show. Atari held a seminar along with David Small of Gadgets by Small and Nathan Potechin with Calamus SL.

The following has been edited and any additional information not part of this live conference is in brackets. []

Special thanks to Darlah Pine, GEnie ST RT Chief Sysop for her assistance!

THE Z*NET LIVE REPORT FROM THE GLENDALE ATARIFEST

(C) 1991 by Atari Corporation, GEnie, and the Atari RoundTables. May be reprinted only with this notice intact. The Atari RoundTables on GEnie are the *official* information services of the Atari Corporation. To sign up for GEnie service, call (with modem in HALF DUPLEX) 800-638-8369. Upon connection, type HHH Wait for the U#= prompt. Type XJM11877,GENIE and hit RETURN. The system will now prompt you for your information.

<R.KOVACS> Hi there, I am waiting for John Nagy too!! Shoud be around shortly!

<DARLAH> Great!

<R.KOVACS> I am going to call.. I will be here but not here in a
minute...

<R.KOVACS> John is on the phone!!!

<R.KOVACS> Attendance today is near 2000!

<R.KOVACS> Bob [Brodie] left early this mornig and Bill Rehbock held the
Atari seminar...Sooooo much news was discussed it is going to take 4
issues of Z*Net to get it out.

<DARLAH> Ask him if our GEnielamp writer was doing his poll..

<R.KOVACS> As far as John know yes...

<R.KOVACS> New Story #1

The TT is class B as of this week!

((((((How many times times have we heard this before? It seems that
each time there is a regional Atari show someone says that
the TT is FCC Class B certified and that there are warehouses
full of them!! So now someone at the Glendale Atari show is
saying that the TT is Class B certified.
We shall see!!
))))))

News Story #2

FSM GDOS starts shipping today at Glendale show as part of the WordFlair
package. It will be available seperate within weeks at dealers.

((((((Ditto with this new GDOS replacement. It always seems to
ready Real Soon Now but it never seems to make it out.
))))))

The STBook was shown at the show, and it is going into production
already.

((((((Just where is the ST Book being produced? Atari sold all of
its manufacturing plants.
Once again remember this date and announcement so that when the
ST Book stillhasn't appeared by this time next you you will
remember just what Atari's promises are worth!!
))))))

<DARLAH> How was it received?

<R.KOVACS> Very well, they were alot of oohs and ahs... Very Sexy sez
John! The STBook has a 10 hour battery life.

<[Larry Rymal] LRYMAL> How much for the STbook?

<R.KOVACS> Around 1800.oo with hard drive.

<DARLAH> what size drive?

<R.KOVACS> The hard drive for the Book is 40 meg will larger available later.

<E.JOLLEY> Does the STbook have a floppy drive?

<[Larry Rymal] LRYMAL> Has it been FCC certified, yet? (ouch!)

<R.KOVACS> News about Falcon and the future of the 1040, but you will have to read ZNET for that one sez John.

<[Go Auburn!] J.COLE18> Ron, any hints to a show stealer for Fall comdex to go agains the Apple 040 machines?

(Job 6)<R.KOVACS> Non hinted

<R.KOVACS> Bill Rhebock spoke for 1 hour 1/2 and there was not a dull moment during it!

<DARLAH> How was sales at the show so far?

<R.KOVACS> The stylis (ST Pad) will be at Comdex. Vendors are complaining that they didn't bring enough product!

<DARLAH> How were the other seminars attended and who spoke?

<[Go Auburn!] J.COLE18> will STpad (or book for that matter) be for sale at Comdex

<R.KOVACS> ST Book will be for sale only at Comdex.
Attendance and sales well over this point last year!

((((((Atari is always promising to sell things at Comdex, but Comdex is not a large flea market so don't go there thinking you are going to buy anything! Just re-read old ZNET/ST REPORT magazines and see how how Atari products were announced at Comdex and never made it to production. Will the ST Book and the ST Pad join the list of VaporWare From Hell (opps I mean Atari)
))))))

<[Dave] D.SHORR> Have the winners of the STe Demo Contest finally been announced?

<R.KOVACS> Real production for the book with pick up after xmas ...
The STPAD will be under $1200.00.

<[jdb] JOE.WATERS> Was FSM GDOSD available for sale?

<DARLAH> with Wordflair

<[FAST TECH] J.ALLEN27> After Xmas? Silly?

<R.KOVACS> FSM only available if you purchased WordFlair. Consumer packing is NOT ready yet.

<[FAST TECH] J.ALLEN27> Pad $1200...Book $1800

<R.KOVACS> Yes

<R.KOVACS> John Tarpinian is on cloud 2300000202054054543000

<DARLAH> I bet he is

<[jdb] JOE.WATERS> Ron ,does that mean that current owners of WordFlair can buy it from Goldleaf?

<R.KOVACS> John will take questions for 5 minutes now!

<[FAST TECH] J.ALLEN27> That leaves little room for the other clouds ;-)

<DARLAH> How did the other seminars go and who spoke?

<R.KOVACS> The seminars total 3, Bill Rhebock spoke with James Grunke, #2 was Dave Small, doing Neil Young again, and the third in progress now is Nathan and Calamus SL and all were HEAVILY 100-200 people in each!

<[FAST TECH] J.ALLEN27> John Nagy....be sure and notice the T25 at the San Diego user group booth, and the TURBO030 at the Computer Network/ ISD booth.

<R.KOVACS> John has noticed it and it is running!

<DARLAH> great show it appears like......very good news

<DARLAH> How does Jim's piece of work look?

<R.KOVACS> He hasn't seen it up close but will take a close up look later...

<E.JOLLEY> Is Stalker supposed to be better than Stealth?

<[Go Auburn!] J.COLE18> Ken, is Gribnif still accepting upgrades? (if they are, are they doing it at the show?)

<R.KOVACS> Stalker is SUPER!

<E.JOLLEY> How much is Stalker running for?

<[Ken] SFRT-ASST> The exhibitors were a little annoyed. They were selling out of stuff. <G>

<[Ken] SFRT-ASST> $40.

<R.KOVACS> Not sure about Gribnif.... Stalker (think.. $49.00) any other questions!

<[Ken] SFRT-ASST> The udgrade is $25. I think. At the show it's $40.

<R.KOVACS> Any other questions for John Nagy?

<DARLAH> Are they seeing brand new users at this show? Or just die hard Atarists

<[Ken] SFRT-ASST> Yes. I think there are more music people around.

<R.KOVACS> Not sure.....

<[Go Auburn!] J.COLE18> Any hints for Multitasking tos?

<R.KOVACS> Earth Wind and Fire (the group) was at the show shopping as was Jim Hotz and other music and screen stars..

<[jdb] JOE.WATERS> Yes, for John: to what do you attribute the success of the H.A,.C.K.S. show after a series of less than wonderful turnouts earlier in the year?

[We missed this question originally and have passed it along to John King Tarpinian to answer. Look for his comments on this successful show in the next regular edition of Z*Net]

<R.KOVACS> Unknown on the STE contest

<R.KOVACS> No multitasking at the show but there is a new TOS.

<[Go Auburn!] J.COLE18> WHAT new tos??? :-)
<G.RICHARDSO1> What new TOS is that?

<[FAST TECH] J.ALLEN27> A 2.05 that fits in the old machines.

<[Ken] SFRT-ASST> MultiGem was showing their stuff at the show.

<[Larry Rymal] LRYMAL> Which old machines? Mega STs and older?

<R.KOVACS> The big change [in the new TOS] is the way it starts up... Perhaps 2.05 , not sure, John needs more info!

<[jdb] JOE.WATERS> John, is it correct that FSM GDOS requires the use of XCONTROL? How does this impact owners of TOS below ver 2.x?

<R.KOVACS> The st-book is already Type C [This was a tying error]

<[FAST TECH] J.ALLEN27> STs as in all the older machines.

<[jdb] JOE.WATERS> Are we talking new ROMS here?

<[FAST TECH] J.ALLEN27> The Book is the best peice of work Atari's done in years...way to go Tracy!!!

<R.KOVACS> To properly operate FSM yes, it also requires 2 meg or more to get the full features!

<R.KOVACS> New ROMS, yes

<E.JOLLEY> What does FCC type C mean?
<[Dave] D.SHORR> When will the ROMs be available? $$$?
<[jdb] JOE.WATERS> Any release date on the new ROMS?

<[FAST TECH] J.ALLEN27> Usable on an Airplane = Class C

<R.KOVACS> ST Book is type B not C my error (Rons)

(((((((Oh good, another ST product which is supposed to be
Class B certified. Remember the STacy? Well, it NEVER
got Class B certified!!
))))))))

<[jdb] JOE.WATERS> Can the old ROMS be patched with software?

<R.KOVACS> ROMs, not announced, but except for using them in upgrades
the difference is insignficant.

<[Go Auburn!] J.COLE18> Any marketing Blitzes scheduled?????

<[jdb] JOE.WATERS> How much meory is it theoretically possible to stuff
in a Mega or an older ST?

<R.KOVACS> If you are using them in an ST you do not need the change.

<R.KOVACS> Marketing plans are magazines near xmas, no TV.

<G.RICHARDSO1> WIth TOS 2 in an older machine you could get up to 15
megs of RAM to live in a Mega.

<R.KOVACS> Computers don't sell on TV, image sells on TV, says Mr. Nagy

<E.JOLLEY> Which magazines?

<R.KOVACS> Publishing and Music and Computer magazines

(((((((But NO ST/TT magazines becuase ALL of the USA ST magazines
are DEAD DEAD DEAD!! And have the Tramiels EVER advertised?
So don't believe this rumor either!!
))))))))

<[Go Auburn!] J.COLE18> Will there be enough machines in the US for an
Xmas Ad blitz?

<E.JOLLEY> Well which computer magazines, just Atari mags?

<R.KOVACS> Any blitz will be co-op, the machines are here and they are
ready!

<[Ken] SFRT-ASST> Mark is running Avant Vector and Dynacadd on it.

<R.KOVACS> Dave Small is relaxing after his seminar...

<R.KOVACS> Mark Booth is selling the buttons for $3.00, people have
tried to pay him more.. They say ST-REPORT, with the universal NO over
it!

((((((A little partisan dig at a competing magazine I see!!
))))))

<[FAST TECH] J.ALLEN27> ;-)

<E.JOLLEY> Geez, that's not very original.

<[jdb] JOE.WATERS> I guess Ralph stayed home?

<DARLAH> yes, Ralph did not attend

<R.KOVACS> Ralph Mariano is not in attendance it is a very up crowd!

<R.KOVACS> He wouldn't have felt at home. :-)

<[Ken] SFRT-ASST> Diamond Back now works with Mega STE's.

<R.KOVACS> Closing comments

<[Ken] SFRT-ASST> The DJ Utilities will be upgraded in the middle of next month.

<R.KOVACS> Everybody is thinking smaller this year. Glendale is the first sign that this type of thinking is wrong.

<[FAST TECH] J.ALLEN27> Anyone showing Matrix video boards?

<G.RICHARDSO1> Did Gadget's anounce a ship date for SST?

<R.KOVACS> John is leaving and thanks you for appearing here!

<DARLAH> Thank you!!!

<R.KOVACS> Color pictures are coming!

<R.KOVACS> AtariUser's October issue was also distributed.

<[Ken] SFRT-ASST> Codehead ran out of Multidesk Deluxe.

<[Ken] SFRT-ASST> They only thought they would sell 20. They ran out of 50 in the first four hours.

<[jdb] JOE.WATERS> I don't think I ever did get an answer to my question about the factors behind the success of the show.

<[anthony] A.DIPIETRO> Any news on Jaguar?? :)

<[Ken] SFRT-ASST> The CDAR 504 was there. It looked pretty good.

<[anthony] A.DIPIETRO> Did the big Ts make an appearance?

<[Ken] SFRT-ASST> T"s?

<[anthony] A.DIPIETRO> is the 504 ready for sale?

<[jdb] JOE.WATERS> The 504 is that not the older CD ROM?

<[anthony] A.DIPIETRO> Tramiels

<[Ken] SFRT-ASST> No one mentioned them.

<[jdb] JOE.WATERS> What was the model number on the CD-ROM that they refused to sell?

<[anthony] A.DIPIETRO> how much (for the 504)

<[Ken] SFRT-ASST> Around 4-500?

<R.KOVACS> any news tomorrow, John will pass it along.

Please note that this has been edited down from the original capture and answers to some questions did not occur although they are listed here. We missed them either by scrolling off or simply missing them altogether.

John Nagy was NOT attending the conference live. He reported over the phone and I typed as fast as possible.

If there is more information worth reporting on this weekend, we will issue an additional report, till then look for a full eyewitness report in Issue #91-40 of Z*Net Online.

Thank you, Bobie. Despite the fact that you insisted on refusing
to admit that you were agreeing with me, you were indeed agreeing
with me. That's all I was looking for.

It's amazing how upset some people can get when you add an 'ie' to
the end of their name. They simply go off the deep end. I'll
never understand this. Many of my friends call me 'Kevie' on a
regular basis, but I don't call them childish. Oh well, live and
learn.

From: yonder@netcom.COM
Message-ID: <1991Sep15.190857.13413@netcom.COM>
Source record: 228907

I got a lot of helpful information from people on the net about how to use zoo correctly and about how to set up the TeX files.

The most interesting message I got said that a version of TeX was available already set-up in an archive file on at a German ftp site. The person who left the message said: ftp.thp.uni-koelm.de

Well, I haven't had any luck ftp'ing to this site or finding it in any list of sites. Maybe some German user out there knows where I can get this great archive that is suppose to include viewers and everything. This archive is supposed to be much more complete than the atari.archive stuff. Well, can anybody help me out.. thanks...

>I'm looking for a way to connect it to a spare ST to make it useful for my girlfriend. Anyone know where I can get a cable that pulls out the composite output from an ST's monitor port? I realize that this will only work in color resolutions and that I'
....

I did just this with an Apple greenscreen and it worked just fine, but I
didn't have the rf modulator in my 1040, so I just passed the R,G,B outputs
from the solder pads where the mod. would have mounted thru pots, the Hsync and
Vsync thru small diodes, tied it all together, and connected it to an
RCA connector on the back.
The modulator should produce an equivalent signal, tho, if you have one in your computer. According to ST Internals, the composite signal is on pin 2 of the monitor connector (looking at the back of the computer, second pin from right on top row) and ground is on pin 13 (very bottom pin).

2682. Lattice C

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 11:35:09 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Sep16.113509.22669@echo.philips.nl>
Source record: 228916

Several years ago when I still had my 520 ST, I did make some programs
using Lattice C compiler. At some time I got a letter from METACOMCO
(in UK) that I could update my version to get the latest version.
I did update, but for some reason never used it since.

Now I have to use a C compiler on my MEGA STE for a small program
and I noticed that my latest Lattice C compiler was version 3.04
(This was printed on screen by the compiler during compiling).

The version I have includes the MENU+, DEBUG, KRSC, ansi C,
making accessoiries, etc.
(Those things were the major update reasons).

However, I see mails on the net talking about version 5.xx.

So I have the following questions:

1. Why did I never got an update mail since?
(Yes I know Metacomco is out of business, but
lattice C seems to be 'taken' over by someone else)

2. What are the major differences of these newer versions?

3. Can I expect major problems by using this old(?) version
on my new MEGA STE?

Thanks

John

2683. Re: Is Fcopy PRO a demo or not

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 12:22:16 UTC
From: lahtinen@gideon.gideon.fmi.fi
Message-ID: <LAHTINEN.91Sep16142216@gideon.gideon.fmi.fi>
Source record: 228912

There is a demo of Fcopy Pro. It came with TOS-magazine
(they are also selling Fcopy Pro), but if I remember right
it handles only single sided disks. I have it so if you like to
see it it can be arranged.

By the way I have also the real thing and I think it is worth the money.
I think the formating is a little bit faster and the manual is very nice
(if you read German). And I think the author needs to get some money
as I really use Fcopy so much.

Well, you're comparing apples <grin> and oranges here. We were discussing peecee emulation. However, in reference to Spectre I would agree with you. This is one instance where the emulator is better than the real thing in terms of cost/performance. BUT you still have lots of campatibility problems. Just check out one of Dave Small's newsletters and look at the compatibility list. A lot of things work and there are quite a few things that don't work as well.

2687. TeX, which do I get? (Now that I know where)

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 13:57:22 UTC
From: yonder@netcom.COM
Message-ID: <1991Sep16.135722.19575@netcom.COM>
Source record: 228919

Well, I had no luck ftp'ing to the koeln site, but the 129.69.1.12 site works..and there is so much TeX stuff there I don't know what to get... And the connection is pretty slow..

Here's what I got doing an ls of the TeX directory:

Lindner-TeX:
Lindner-TeX.packed-disks:
Ridderbusch-TeX:
bammi-TeX:
cs-tex:
driver:
passautex:
texutils:

Which of these versions should I use? The CS version looks pretty good... Somebody meantioned the Lindner version in a message to me. What is the passautex? There is TeXdraw stuff in both the texutils and passautex directories....

Hey, looks like I might get TeX working after all, looks like now all I got to do is pick a version and spend a week unpacking and setting up files.... thanks.....

2689. Novice Needs Printer Driver Help

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 15:38:46 UTC
From: rost@rgb.dec.com
Message-ID: <1991Sep16.154719.7892@ryn.mro4.dec.com>
Source record: 228920

I don't know if this is a FAQ, but being a relative novice to the ST world, I have a question about printer drivers.

I currently have one printer, an ancient Okidata Microline 82. It has graphics ROMs installed, but there's two problems:

1. It's not Epson graphics compatible

2. The driver example given in the docs is for an Apple II!!!

It works fine printing staright ASCII but I can't use it for screen dumps or graphics. Not to mention neither of my WP packages supports it.

I'd like to write a driver but have no idea how to go about it. I guess I need some sort of template with comments to work from. Or if someone actually has written a driver for this thing, I'd love to get a copy of it.

Second question, I'm planning on buying a Pansonic 1123 in the near future. As this is a 24-pinner, I'll need a driver for this puppy too. Does anyone have a source for this? If it helps, it is supposedly compatible with Epson LQ-850.

Third question, how do I get the drivers to run from the desktop to allow screen dumps? I.e. how do I do the equivalent of "install printer"?

2690. Wall Street Journal article

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 17:04:34 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Sep16.170434.12094@chinet.chi.il.us>
Source record: 228921

There was a big article in today's Wall Street Journal about palmtops. It seems that every player in the field was mentioned EXCEPT FOR Atari and Poqet, who somehow seem to be the most obvious players. This is about the third time WSJ has left Atari out of an article on palmtops (the first time they've forgotten Poqet, though). It would be a nice test of Atari's corporate fitness to zip WSJ enough canned information so that the next article on palmtops will include Atari stuff.

Well, Neodesk's clipboard really seems to be a variable size RAMdisk. You
can copy files to it, and then switch floppies, (or whatever you're
using) and copy it from the clipboard to the destination floppy. But the
clipboard never uses more RAM than the size of the files in it (with
maybe a little overhead for FAT etc) and doesn't eat any program space.
But, if you have files in the Neodesk clipboard, and then execute an
application, then those files will be lost...

Are you really that surprised? As an exercise, go out on the street and ask 50 people what Atari means to them. I guarantee you at least 48 of them will say something like: "Oh yeah, they made those cute little video games back in the late 70's and early 80's. They're still around?" Atari's attempt at making a name for itself in the computer business has been a textbook case of blown advertising.

Also, the fact that the Portfolio had horrendous reliability problems when it first came out doesn't help at all. My boss owned one for a few months, but he NEVER got one that worked properly and he had it "serviced/replaced" twice. He ended up buying a Sharp Wizard.

Let's face it, a couple dozen Atari cheerleaders ranting on Usenet isn't going to pick Atari up off its ass. If they want people to buy their products, they'll have to market products in a timely manner (not a year or two after everyone else) and they'll have to advertize so that people will know that these products exist. If Atari could get back the competetive edge it had 5 or 6 years ago they might start earning some money...

Cheers,

Chris

2695. Graph program for A-Calc Prime?

Newsgroup: comp.sys.atari.st
Date: 1991-09-16 21:07:00 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1991Sep16.210700.25121@ccu.umanitoba.ca>
Source record: 228927

I've been using A-Calc Prime for as long as I can remember. It's a pretty basic spreadsheet, but it suits my needs very well and I'm quite familiar with it, so I'm loathe to give it up. I seem to recall that a separate graphing utility was released for the program ("A-Graph" or something like that?). Does anyone know where I might find a copy? Alas, I fear that it's not commercially available, since Antic stopped distributing A-Calc ages ago. Does anyone have an old copy they'd like to sell?

I have used zoo with complete success, many times, running under TOS1.0.
It works particularly well from within argsh.prg, which i believe is
available from atari.archive.

As far as I know, the software for the Matrix 19" monochrome monitors
consists of two parts. One of them is GOLIATH, which is a complete
driver with GDOS support. But it is very very slow.
So MATRIX added another driver named DAVI, which is capable to support
some screen accellerators like Turbo ST and Quick ST II. We tried
to install NVDI in several ways, but it broke every time. DAVI is written
by some guys from France and if you know of TURBODOS, you may understand
why this can't work. OK, this is another prejudice like "GFA programs don't
make reliable redraw".

On the ATARI Messe in Duesseldorf we asked at Matrix, if they will deliver
a new version of their drivers to run NVDI, but they said "Monochrome is
out of time" and they probably will not support tose screens in the
future.

What about Arnd Beissner's PROTAR screen driver, does he support all
screen accelerators or is it fast enough without them. I never saw
an article comparing the quickness of these graphic cards.

Bye......Michael

>
>Here's what I got doing an ls of the TeX directory:
>
>Lindner-TeX:

The perfect one, always reliable with a nice shell. speedy and makes the best output. It's shareware. Since Metafont is not ported by Stefan Lindner himself and Lutz Birkhan hasn't ported the version 2.9 to the ST, you have to run SL's TeX 3.1 combined with old Metafont 1.7

>Lindner-TeX.packed-disks:
>Ridderbusch-TeX:

Since Frank Ridderbusch is inside the GNU-project, this could be a port using GNU C. I've never heard of this one.

>bammi-TeX:

Should also be ported using GNU.

>cs-tex:

Christoph Strunk has ported full TeX 3.1 and Metafont 2.9 using Laser C (As I remember). It's a complete set with a small but useful installation-program. CS has made some arbitrary modifications to the TeX macros, so that the output may look a bit different from original versions, but it's handy (as a 5 MB systems can be) and complete.

>driver:
>passautex:

I know of an Amiga version of TeX named PasTeX, this should be that one.

You may remember I had the same problem a couple of months back. The guy at First Coast who I spoke to (they sold me my HD) said that ICD were now making the host adaptor boards with this wonder-capacitor already build in. The replacement I received was, indeed, untouched by Third Coast hands, and had the fix.

From what I have read there is No Real Flash 2.0.
There is a Ozzy Version that has useses the Name Flash 2.0,
but has nothing to with Flash at all..

2707. Re: TeX, which do I get? (Now that I know where)

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 12:35:16 UTC
From: raichle@azu.informatik.uni-stuttgart.de
Message-ID: <RAICHLE.91Sep17143516@azu.informatik.uni-stuttgart.de>
Source record: 228931

> Well, I had no luck ftp'ing to the koeln site, but the 129.69.1.12
> site works..and there is so much TeX stuff there I don't know what to
> get... And the connection is pretty slow..

129.69.1.12 is rusinfo.rus.uni-stuttgart.de
This is DANTE's ftp server.
(...and DANTE is the german speaking TeX users group.)

> Which of these versions should I use?

Either you can use a whole package (i.e. Lindner-TeX (Shareware) or
CS-TeX (Public Domain)) or you pick up the needed TeX, MF, previewer,
printer driver, utilities, fonts, ... piece by piece.

> What is the passautex?

This should be `br-TeX'. This is my own version of TeX 3.1. You can
set TeX's array sizes with the help of a configuration file (and it's
one of the fastest TeX on the ST). But... it's TeX only!

Personally I use the CS-TeX package as base. I have replace the TeX
coming with the package by my own version (which is now at 3.14 and
will be put on the server in a few days, I hope). As previewer and
printer driver I use ShowDVI (+ DVIprint).

> There is TeXdraw stuff in both the texutils
> and passautex directories....

Try to get the newest version. I have TeXDraw 1.79.

Hope this helps

2709. Flight Simulators wanted

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 13:12:05 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <9894@vela.acs.oakland.edu>
Source record: 228937

I keep replying to people that have flight simulators for the ST for-sale
on the net, and getting no replies, so I thought that I would ask directly.
I am looking for either flight simulators, or combat flight simulators with
an increased level of realism. I am specifically after Flight Simulator II
by SubLogic or perhaps Solo Flight, but I am willing to consider buying other
programs as well. I am also interested in getting a version of Falcon as there
are so many mission disks for it. I have already tried the original F15 and
Stealth Fighter (I liked it, but it had a bug I didn't like).

If anyone has any of these, or anything else that the think might be of
interest, please let me know.

Also, I am interested in in any information that anyone may have about
running a high resolution stick with a flight simulator on the ST...

thanks

swood

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Jeff Weiner will only forward them to Jon, so please save him the time. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter e-mail address in response to Password prompt>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

The mail server has also moved. Send an e-mail message to

info-server@ftp.Informatik.Uni-dortmund.DE

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be a valid internet or uucp address. For bitnet users name@host.BITNET usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl26.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5

```
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordFlair, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

HAM
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.1) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran

by newly acquired SIG Operator, Peter Haller, a professional programmer
who is running developer sections on hardware and software development,
programming, MIDI applications development, Graphics Design,
plus many other sections that can definitely become a programmer and
developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured
Product Info and Support Board and a new Special Applications Board.
The Support Board includes a vast library of support lists. These lists
range anywhere from phone numbers of Atari dealers and producers, to
software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software.
To sum it all up this area covers what's out there, who makes it, and how
to get it for all Atari products. The Special Applications Board is
just starting out. Currently there is an area for users of MIDI on the
ST. MIDI users are encouraged to use this as a means to discuss MIDI
related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it
via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu"
or by calling (216) 368-3888 300/1200/2400 bps. Once on the system,
a user can apply for an account application and logon as a visitor.
Once here, simply type "Go Atari" to get to the Atari SIG. A visitor
can go anywhere on the Freenet and can read anything. They can't
post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost

of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews, or more information on other magazines, please send them to me via e-mail. As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free [$6.00/50 magazine shipping charge] from participating computer dealers, bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year) Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine (Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people.
Lively, but of uneven quality. Big leisure section, but other areas
covered too. Includes cover disk - mix of games demos and (usually out
of date) PD utilities. Probably the biggest-selling UK ST mag. Has had
several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper
(monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2,
D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

2712. Overview of TeX-Installations

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 13:58:13 UTC
From: wolf@sol.cs.uni-sb.de
Message-ID: <WOLF.91Sep17155813@sol.cs.uni-sb.de>
Source record: 228932

As the question ``what TeX should I use?'' raises from time to time in this group I think a short overwiew of the currently available systems, describing their main features, differences, advantages/disadvantages, and the main places you can get them, would be a great help for TeX newcomers on the ST.
If such an overwiew doesn't already exist I would be willing to put one together and post it or put it on an archive server.
I know a few systems but I would like to get some more information from you out there to make the information more complete.
Interesting details about the systems will be, e.g. author, TeX version, hardware/os requirements, memory/disk space used, performance, user interface, driver/fonts available and so on.
If you want to contribute, please send me your information via e-mail.

Greetings,

Wolfgang

>
>Regards,
>
>Chris

The list may look bad, but if you look real close, nearly everything that does not work is junk, either really old software or games (I hate computer games). I use one nearly every day, with ADspeed & the ISAAC board, and I have, literally no problems. I also do consulting for the Macintosh and IBM systems, and the more I use the Macs, the more I like the Spectre! We have many little incompatibilities on the Macs that there just don't seem to be on the Spectre. One example is SUM TUNEUP, on literally (without exception, I'm not exaggerating) every Mac we tried it on, we got "unidentified error #0, optimization cancled". I tried the program on the Spectre GCR, and it worked perfectly on every partition. I've found absolutely no major software that does not work, and only a couple of really hardware-based inits or cdevs. I've never had any trouble with any Desk Accessory. I guess I should point out that I run a very high powered system. I use everything I've got on my hard drive for DTP projects (although I use CALAMUS for the final product). I don't just run the Spectre and a single word-processor, and say "it's great". I use it for extended periods of time and use a number of hihg-end programs as well as many little utilities...

Generally, what I'm trying to say is.... This sucker is better than a Mac, at least it is better than the Macs I've used, and I've used lots...

2714. Re: ST memory allocation

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 14:21:46 UTC
From: micro@imada.ou.dk
Message-ID: <1991Sep17.142146.27354@imada.ou.dk>
Source record: 228950

slammy@admiral.uucp (Dave Litchman) writes:

>Well, Neodesk's clipboard really seems to be a variable size RAMdisk. You
>can copy files to it, and then switch floppies, (or whatever you're
>using) and copy it from the clipboard to the destination floppy. But the
>clipboard never uses more RAM than the size of the files in it (with
>maybe a little overhead for FAT etc) and doesn't eat any program space.

This is a totaly diffrend story. NEODESK and any other application can
allocate memory and put things in that memory. . NEODESK's clipboard
is build into NEODESK, and it therefor don't have problems by allocating
memory.
The original poster wanted to allocate memory form a terminated program,
that hooked into the harddisc vectores. The harddisk vectores is called
from BIOS level, (the lowest level in the OS). NEODESK is running on the
application level (the highest), and can therefor use all parts of the OS.

```
APP
|
GEMDOS <----+ Malloc/Free
| |
BIOS -> HDV -+
```

This is how the variable size ramdisc should do, note the loop! This should
and is NOT legal in a hiracial OS.

Note, with a filesystem build on to of GEMDOS, it would be possible to make
calles to GEMDOS - from within the filesystem...

NOTE this is not what NEODESK does. This is:

```
APP ------+ Malloc/Free
| |
GEMDOS <----+
|
```

And that is (ofcause) legal...

-Klaus

(I don't know anything about NEODESK, I don't have it, I have never run it,
nor have I disassembled it - so I might be wrong, but I don't think so).

2715. Re: Tos 2.0x coming to an STf(m) near you... NOT!

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 14:57:38 UTC

[stuff deleted...]

> R> Yes but if my figuring is right the to 2.x SHOULD be able to fit...
>
>You are right, it does fit in STEs. Someone from Atari Germany confirmed this.

I can confirm this as well. I've been running TOS 2.05 on my 4MB STe for almost half a year now, and I haven't encountered any problems as of speaking. The 2.05 roms of the Mega STe fits right in a an STe, so if you happen to know someone who owns a Mega STe who is willing to hand over his 2.05 roms to you, or you buy two 1024 kbit eproms (which happen to be pretty expensive), you're pretty much saved.

I couldn't/didn't do any of the above, so I wrote myself a program to run the 2.05 roms off a harddisk. Works perfectly (at least for me). I were going to patch it to work on an ST as well, but this hasn't been accomplished due to the lack on a normal ST (everybody within reach seems to have upgraded to either an STE or a Mega STe).

If there's interest, I can post the program on Atari-archive.

2716. program compatability w/STe's

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 15:22:05 UTC
From: chang@cme.nist.gov
Message-ID: <8594@squire.cme.nist.gov>
Source record: 228940

Has anyone compiled a list of programs that do and don't work
for the STe family (does this list differ between the mega and non
mega STe's?)?

In particular, before I move up to an STe of some sort, I want
to kow if there are any problems running the following programs:

Cad 3D
rest of the Cyber series
Master Tracks Pro 3.5(1?)
Timeworks DTP (pretty old version form 87 or 88)

Anyone w/ a Mega STe run Master Tracks Pro? DOes running at
16MHz, vs. 8 affect the running speed of the pgm, i.e. all your old
sequences have to be slowed down, etc?

I may be intereested in compiling a compatbability list if no
one else has done it.

Fo

2717. Re: SIMMS from a Mac SE into an ST?

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 16:30:07 UTC
From: cjherborth@rose.waterloo.edu
Message-ID: <1991Sep17.163007.26794@watdragon.waterloo.edu>
Source record: 228946

In article <1991Sep16.005329.3341@rodan.acs.syr.edu> ggreenbe@rodan.acs.syr.edu (Gerald Greenberg) writes:
}I've got access to 1 meg worth of memory pulled from a MacSE
}(I believe it is in the form of 256K simms). I was wondering
}if it is possible to use this memory in a 520ST? If so, what
}would I do to install it, and how much total memory would it
}give me?
}--Gerry
}ggreenbe@rodan.acs.syr.edu

If your 520 has only 512k, you'd be able to install two of them as bank 1, and have 1M of RAM. The other two 256k SIMMs would be able to sit around gathering dust (or you could sell them to another 520 user)...

It's much better to get 1M SIMMs. You can then easily (well, if, unlike myself, you know how to wire them in properly) pump your ST up to 4M, unless you're unlucky enough to have an old (1985) 1040 STf, like I do. For some reason, my MMU won't take more than 512k in bank 0, so 2.5M is as high as I can go. This same thing is true of my friend's ST (1985, 1040STf), so I suspect it's true of all 1985 1040's... As far as I know, old 520s are fine though.

Does anyone know how I could get around this? Install a newer MMU? Have you done it? :-) I'd really like to go to 4M one of these days...

2718. DC weekly program post

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 16:45:14 UTC
From: uace0@menudo.uh.edu
Message-ID: <1991Sep17.164514.13904@menudo.uh.edu>
Source record: 228945
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This week's program has been sent to the ftp site atari.archive.umich.edu and to the moderated newsgroup comp.binaries.atari.st.

DC No Alert will keep an alert box from being displayed and will 'fake' return of the DEFAULT button. So, in an alert that says, "Really Quit?" with the YES button being the default, you'd hear a little 'bing' and that's it. The YES button will be returned as the button selected. 100% assembly. ST, STe, and TT compatible. Program of the Week.

For all interested Creator/Notator users, I have just recieved my copy of the Creator 3.1 update from C-Lab. The update costs $35; I believe the program now sells for $325 new.

First off, there's a new graphical arrange mode, using a grid that you can zoom in and out of (like Hyper Edit). You can use it as the old arrange mode, or utilizing new cut & paste functions.

Also, when using 32 tracks/pattern, you now have the option to view all 32 at the same time (with all parameters, of course).

There is also a slew of new very detailed and flexible note-processing functions, allowing such things as global shifts over the entire arrangement. Since I'm still finding new things to do with the old transform and re-mapping pages, I haven't really gotten to this stuff yet.

Also added is control for compatible Fostex tape machines.

For Notator users, notation output now supports Calamus and Pagestream formats.

Also included, naturally, is a new manual.

So far, I've found the 32-track display and the graphic Arrange grid particularly useful, since I use about 45 MIDI channels spread over hundreds of tracks. It's now a lot easier to get a grip on overlapping patterns and patterns that start and end in strange places (fractions of beats, etc.)

C-Lab's distribution # is (415) 255-2091. I'd like to hear other users' impressions of the update.

focke@gmdzi.gmd.de (Stefan Focke) writes:
|piet@cs.ruu.nl (Piet van Oostrum) writes:
|>Is ARJ (or UNARJ) available for TOS?

|Yes. But only UNARJ.

Pity, that. I'd dearly love to have ARJ.
And a word to whoever's doing the port:
PLEASE do an integrated GEM version! The bewildering array of swiches on the DOS version of ARJ is enough to make me tear my hair out every time I try to use it! Geez, it's powerful, but geez, it's also REALLY confusing!

Otherwise I may have to take a few weeks out of my vacation next summer and do an integrated version myself :)

Seriously, it would be swell to have something along the lines of StuffIt, based on ARJ, for TOS. Heck, I'd prolly even pay money for it.

Does Maccel3 exist? xcontrol asks for maccel3 and all I could find was maccel2.

2725. Question about SST board from GBS

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 20:06:24 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Sep17.200624.13750@umbc3.umbc.edu>
Source record: 228942

Does anyone know when the SST board is going to be released? I read in an online conference in ZMAG that the board was to be released in the first part of August. It's now mid September and I haven't heard a peep from them or this newsgroup.

Thanks for any info!

2726. Atari Computer for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 20:13:39 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Sep17.201339.15190@umbc3.umbc.edu>
Source record: 228943
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

FOR SALE:

Atari 1040 ST
1 meg main system memory
Internal 720K 3.5" disk drive
TOS 1.4 Operating System ROMs
Surreal Systems internal clock chip
Atari SC 1224 Color monitor
Original super-sharp JVC model
Semi-"Home-brew" hard drive
SH 204 case and power supply/fan
ICD Advantage Host Adapter (w/clock)
OMTI SCSI-to-MFM converter
Seagate ST-251 40 meg drive (flakey)
DMA cable
Atari standard mouse
WordPerfect for the Atari ST
Abacus Chartpak
Misc. system disks for the above system
...and any other misc. Atari formatted disks that I have

All this great stuff for just $700 or best offer!

If you have a trade in mind, then go ahead and ask. For now,
I am looking for mostly IBM and generic stuff: SCSI Hard drives,
laser printers, Roland MT-32 or LAPC-1, etc...

I'd rather sell the system as a whole, but if I get offers
for most of the pieces, then I'll go that way.

Anyway, if you have an offer, then make it! The worst thing
that can happen is that I'll say "No way!"

I prefer email, but if you would rather call, you can reach
me at (301) 521-0015.

Thanks!

I just saw several of them running at the Glendale Atari Faire. They said they expect to have production underway in 2-3 weeks. Looks like a real winner... I brought a copy of Fractint to run, it was easily 10 times faster when running in fast RAM on the SST. (Ran side-by-side with a non-accelerated STacy.) Running in ST RAM there wasn't a whole lot of speed increase. If you've got programs that can only run in ST RAM it may be kind of bothersome, might make the thing less worthwhile for you. The only thing I can think of that would run only in ST RAM tho is a program with statically allocated screen or disk I/O buffers.

This begs the question, has anyone run it side by side with a TT? I would
be curious to see how it compares to Atari's 68030 box. If the speed is
comparable then users could save big $$$ by purchasing Dave Small's upgrade.

Regards,

Chris

p.s. The last Gadgets newsletter I got list the SST's price at under $1,000.
It makes a lot more sense than buying a TT if the speed is up to snuff.

God, a half duplex computer service, and people use it in droves. (Sorry, uncalled for editorializing... And yes, I know you can set it for full duplex, but it always resets to half duplex after a file transfer. Stupid system.)

There was a pretty interesting story about that FCC certification. Seems they fired their previous FCC certification lab and hired on a guy who's an old hand at getting stuff certified, and he got 'em certified real quick.

> <[FAST TECH] J.ALLEN27> Anyone showing Matrix video boards?

Didn't see that, tho I saw two other video boards. "reSolution" being marketed by RIO Datel, and OmniChrome by Omni Peripherals Inc. Both looked pretty slick, tough choice which I'd want. reSolution is like super VGA, 256 colors out of 256K, resolutions up to 1600x1200. OmniChrome is also 256 colors, but out of 16.7M, and the specs I saw said rez only up to 800x600. Both are specs for non-interlaced. (Cool!) reSolution is $500, but they wanted to charge another $60 for the NVDI driver, which seemed a little poor to me. Oh well. OmniChrome was $200 for their "Level 1" product, which was only 640x480.

> <G.RICHARDSO1> Did Gadget's anounce a ship date for SST?

Soon. 2-3 weeks, probably. If you wanna order, order fast because they got swamped with orders from the German folks already...

The 504 is the older model, the 505 is coming out but they didn't have
one at the show. The 505 has no ACSI port, only SCSI.

I wasn't gonna mention it before, but since you ask - considering that the SST board is certified to run up to 40MHz, it's pretty obvious to me that you can go faster than a TT with the SST. The bare board is $600, you have to buy RAM and processor(s) separately. The board accomodates up to 8 MB of SIMMs. Sockets for '030 and '881/882, and there is also a processor-direct slot. It replaces the onboard 68000, leaving the Mega bus slot free.

2731. What is the latest version of FS II???

Newsgroup: comp.sys.atari.st
Date: 1991-09-17 22:26:04 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <9907@vela.acs.oakland.edu>
Source record: 228757

Anyone that has the latest version of FS II, I could really use your help.
I am having problems getting my version of FS II working on my STe. I was
told that I could send the thing all the way to Indiana to get a new version,
but there has to be an easier way about it. Anyone that does not believe
that I just bought a copy of this thing, just drop me email if you think
you can help, and we can figure something out (I hope) or call me directly
at 313-394-0080

I do not wish to illegally copy this software, just update it. I bought it
from a local store as 'new merchandise' only to find out that it was in
fact used, and old. Not only that, but they have no more copies of the
newer version. So it is either find an updated version or mail to Indiana.

thanks

swood

Date: 1991-09-17 23:26:58 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Sep17.232658.4637@umbc3.umbc.edu>
Source record: 228754

Howard and Chris, thanks for the replies!

I have my 33mhz 68030 and 8 megs of RAM ready for the board! All I need to get is a 68882 and the board itself....

BTW, do you happen to know what speed of RAM I should have? And, does the 68030 automatically use the 68882 or do the programs have to be written for it?

Thanks again!

This would really suck if you couldn't put one of those nice SST
boards in a MEGA STE...

Really suck indeed. Most people are dumping thier MEGA ST's for STE's.

I wonder if Mr. Small has taken this into consideration.

I hope so!! I would love to buy one of those boards at the November
show in Chicago.

Programs would have to be recompiled to use the '882... Though I think
some floating point libraries are set up to use the '881/'882 if it's
there, otherwise they do (slow) emulation. That's hersay though... ;-)

I think your RAM should be 80ns or faster... 'could be wrong though.
Dave Small found some 60ns 1M SIMMs for about $41 US a peice in a MacUser
or something like that (Mac magazine...). As with the CPU, the faster
the better...

There was a Flash 2.0 under development by Antic just before
they dropped all Atari support. The last news I heard on
GEnie was that Lexicore was helping the programmer negotiate
the rights back from Antic and would distribute it wehen it
was done. That was last spring and there's been no news
since.
I guess either they got to busy with their graphics packages,
which are still not all released, or they didn't reach an agreement
with Antic.

Message-ID: <A6256@hh.maus.de>
Source record: 228898

Since some People are experiancing some trouble with OXYD here some info
which may help you.
Meinolf Schneider has his own business now and you can reach him
at this address:
Dongleware Verlag
Meinolf Schneider
Im Spitzerfeld 30
D- W6903 Neckargemuend

Telephone and Fax: Germany 06223-8740

When calling from overseas you have to skip the leading zero.

OXYD was a bestselling game in Germany and Meinolf comes in Oktober
with the second part called OXYD2. He also designed a new game called
SPACOLA which is a space adventure. All these programms are Dongelware.
This means that you can copy these programms freely and you can play
the first couple of levels. But to play the entire game you need a
code Book. The Dongle. The book for OXYD costs 50 DM.

But definitively NOT the best adress for RELIABLE compression programs, especially not for zoo. Write to Gereon Steffens (gs@k2.maus.de), he did a fine TC port of Zoo 2.1 (including ARGV), and most people I know now use HIS version.

This is simply not true. Nobody I know has upgraded their Mega to a Mega STe. In fact, everyone I know looked at the Mega STe and laughed (have you ever seen, better yet used the keyboard, what a piece of junk!). Everyone I know, including myself, with the original Mega's is wonderfully happy with them and just won't consider "upgrading". AdSpeed is better than the Mega STe 16mhz 68000 settup too, seeing as it will switch, hands-off, at the execution of any program you set it to, and switch back when you quit. The local store has a Mega STe they have not been able to sell for 6 months, but still gets TONS of requests for the original Megas. Whenever they do get a Mega in, it sells the same day, meanwhile the Mega STe sits there..... Also, the compatibility seems to be extremely poor. Virtually none of the demos, and a couple of applications crashed and burned in the Mega STe, even with the cache turned off and running at 8mhz. All these same programs work fine with AdSpeed. Lastly, ever seen how the hard drive is held in a Mega STe? GLUE, can you believe it! Take the little case on the right side of the machine off and just look at how Atari installed the hard drive, this is why the hard drive is so damn loud (it sounds like it is destroying itself anytime you do drive access). Wait, one last thing, the hard drive light is not built into the machine. Ever noticed that the hard drive light is difficult to see because it is so dim? This is because the "light" on the Mega STe is really just a hole with a little piece of plastic in it. It relies on the light built into the drive, which just sits in there behind the little piece of plastic...now that's engineering for you.

Really though, my biggest gripe is the keyboard, I've literally never seen a keyboard on a modern computer this poor (it makes a Mac Plus keyboard look good). Anyone that has a Mega STe should know that you can purchase the original MEGA keyboards from BEST electronics, and they will work fine...

2742. Atari Mega 2, Notator for sale

Newsgroup: comp.sys.atari.st
Date: 1991-09-18 13:48:41 UTC
From: dan@midi.enet.dec.com
Message-ID: <4135@shodha.enet.dec.com>
Source record: 228768
Cross-posted to: comp.sys.atari.st,misc.forsale.computers,rec.music.synth

For Sale:

Atari Mega ST2 computer: 2 Meg RAM, internal floppy drive with
2 30 meg HD's in a single case ("roll yer own project")
Atari monochrome monitor

Software included:
Neodesk, Band-in-a-Box, TakeNote (ear training/music software),
DX/TX Synthworks (patch editor/librarian for DX7 series synths),
lots of PD games and utilities

Hardware in *mint* condition - only moved a couple times. All for $750 or bo.

****

Also for sale: CLab Notator *version 2.2* (can be upgraded to 3.1 for $95)
The most powerful sequencer and notation software out for the Atari.

Only $250 or bo. (Note: typical retail price for Notator is $500 for 3.1)

****

Everything may be seen in Nashua, NH.

Send mail to dan@midi.enet.dec.com or call (603)881-1999
or home (603)891-2880 at night

2743. Re: Question about SST board from GBS

Source record: 228769

I have never been one to say that Atari's machines are any good pieces of masterful engineering, far from it. Most of you know me enough to write me flame mail on my wise cracks about Atari in general.

However, the points you raised about the Mega STE's could be said of any machine Atari makes. MEGA's are not immune with thier incredibly cheesy power supplies, something I am glad to see Atari fixed with thier switching power supplies in the MEGA STE's. At least I don't have to worry about adding a 100+ Megabyte HD and having my power supply literally die from the load.

I don't know about you, but the MEGA keyboards aren't all that great component wise either, they are designed with the same screwy under the river through the woods joystick ports as the 1040ST's.

I personally love my keyboard, Dave and it does have a solid feel on my desk. The smaller key tops enable you to type much quicker, without hitting a nearby key.

I would also suspect there are some interesting capabilities and products in the future for the VME bus on Mega STE's also. (Although probably not available for sale in the US, Europe already has cpu cards, display cards, etc for people to buy.)

The MEGA STE also comes with a bar none onboard host adapter for its internal HD which blows a lot of equavalent HD setups into the weeds.

As for the AdSpeed advantage, I don't know yet, a friend of mine has recently upgraded his MEGA just as you say, internal HD, plus an AdSpeed upgrade...as soon as we get together I'll let you know.

But all in all, the MEGA STE is a vast upgrade, from the MEGA's. And considering you get an HD, VME support twice the speed, and a nice box to fit it all in, its pretty nice. TWO power cables. Thats it.

You also get three different serial ports, a LAN port. 4096 colors standard, stereo sound standard, the capability to add a 1.4 megabyte drive with a simple chip and drive swap, makes the MEGA STE a very very strong contender for the new 68K flagship machine.

If you look at the price to, for what a MEGA ST/4 use to cost, and what you can buy a MEGA STE/4 for now, I think its cheaper, but still a bit pricey.

I personally can't see with all this going for you, why you would buy a MEGA 4 and spend mega bucks, and sacrifice features, and then on top of that buy Mr. Small's SST board.

If he is counting on that, which I don't think he is, Mr. Small isn't going to make as much money as I previously stated.

Dave Small is much smarter than that.

--Greg

(Read it and weep people, the only defensive message I will make, it wasn't even all that defensive really, just a factual comparison. The closest I will EVER get to supporting Atari.)

2744. 128K Mac ROMs for sale!

Ok, now for something totally off the subject.

I remember reading about using a mega keyboard with an orginal ST. Since
I'm in the process of moving my ST to a PC case, this would help me
instead of adding a cable to my original keyboard and using it bare.
Does anyone have any information they would kindly impart on doing this.

And what is the going price for a keyboard?

2747. CLAB Flames! (Re: Creator/Notator 3.1 Update)

Newsgroup: comp.sys.atari.st
Date: 1991-09-18 19:53:45 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <1991Sep18.195345.3235@watserv1.waterloo.edu>
Source record: 228788
Cross-posted to: comp.sys.atari.st,rec.music.synth

I have been using Creator since v2.1. I purchasd the 3.0 update
at a cost of $80CDN. The new manual is nice. Great... it would have been
nice to have had it when I was first starting out. The new version is fine
except that I bought it for one particular feature - song chain. This new
feature apparently doesn;t work. CLAB said 'Oh well'. Great. Assholes.
Then v3.1 comes out for $40CDN. Instead of trusting them, I borrowed the
store copy and sure enough the SOFTLINK feature doesn;t work - it won;t
continue to play the sequencer when you switch partitions - useless. So,
for $120CDN you get a new manual, but you already know how to use the sequencer
because you spent weeks with the poor translated original manual, and you get
some new bugs. Damn them.

>BTW, do you happen to know what speed of RAM I should have? And, does the
>68030 automatically use the 68882 or do the programs have to be written
>for it?

80ns is the slowest I'd consider, which will work fine for 33MHz. 60ns is good if you're gonna run at 40MHz or faster. (Certified at 40MHz, means a 10% margin, so 40-45 MHz for you real speed freaks.) Also, you must use page-mode DRAMs, not nibble mode or static column mode. (Page-mode are typically the cheapest kind of DRAM so this should be no problem.)

Programs have to be written specifically to use the math coprocessor. You could probably get an emulator working pretty easily. The SST ships with TOS 2.05 onboard, so there is no Line-F trap conflict.

At any rate, while the '030 will automatically run most 68000 code much faster, there are new addressing modes and such on the '030 which could conceivably yield further improvements for '030-specific code. (As well as obvious stuff like the 32-bit integer arithmetic vs the 68000's 16 bit instructions...)

>I would also suspect there are some interesting capabilities and products
>in the future for the VME bus on Mega STE's also. (Although probably
>not available for sale in the US, Europe already has cpu cards, display
>cards, etc for people to buy.)

VMEbus. Yeah! Despite folks gripes, A24/D16 is not a waste of time. There are plenty of useful devices out there that only require 24/16 bus size: ethernet boards, terminal multiplexers, drive controllers... The only thing you might want A32/D32 for is memory, and Atari never intended to hang memory off the VME bus.
>
>The MEGA STE also comes with a bar none onboard host adapter for its internal
>HD which blows a lot of equavalent HD setups into the weeds.

Sounds cool. Obtw, I currently have my 1040STe and Mega 4 ST sharing a single SCSI bus. Pretty cool, as long as I don't try to boot both machines at once...
>
>As for the AdSpeed advantage, I don't know yet, a friend of mine has
>recently upgraded his MEGA just as you say, internal HD, plus an AdSpeed
>upgrade...as soon as we get together I'll let you know.

I ordered an AdSpeedSTe for my system. I'm kinda bummed at not having
a Mega STe. Oh well.
>

>very strong contender for the new 68K flagship machine.

Also sounds very good. Another btw - there was a company selling 1.44MB
drive+controller for $159 at the Glendale fair. Tiny board that replaces
the WD1772 chip. But news is that Atari is coming real close on their
single-chip replacement, so the options are ever-widening...
>
>If you look at the price to, for what a MEGA ST/4 use to cost, and what

>of that buy Mr. Small's SST board.
>
>If he is counting on that, which I don't think he is, Mr. Small isn't going
>to make as much money as I previously stated.

And who's to say that it won't work in a Mega STe. The only reason that it's
listed as only for Mega STs is that those are the only systems with enough
space inside the case. The implication is that if you own a 520 or 1040 and
don't mind ripping it out of its case and installing it in some other chassis,
you could also use the SST. I don't know anything about the STe so this is
purely speculation, but I'd guess since the SST already has to talk to the
ST bus at 8MHz, it should work in 1040 STe and Mega STe as well. (Problem then
is simply getting the right chip socket.)

Dunno about a Mega keyboard, but you could also get a DEKA extender kit, which lets you hook up any PC keyboard to your ST. Don't remember how much those cost. Also sold by Omni Peripherals Inc. Saw a couple of them at the show, pretty nice. They have also done something to the mouse driver which makes it handle higher speed motions. (Try this with your mouse sometime - just move it back and forth as fast as you can. Or if you have a trackball, give it a good whirl. Instead of tracking from side to side as it should, the cursor will probably shake back and forth in about a 2-3 inch span. The DEKA part also fixes this, so you *can* really move the cursor quickly, and precisely. Of course, while I was impressed with this demonstration, I wasn't sufficiently motivated to buy it for myself...)

>Dang, I didn't see that. Oh well.
I saw both of them while I was there, although all I got to see of the T25 (which is FAST's 25MHz 68k running in a Mega2 box) was it doing a cheesy bounce demo (which was admittedly fast). I believe he said that it had a 68881 in it too.
As far as the TURBO030 and the SST, I saw the reps from GSB and the rep responsible for bringing the TURBO030 to the fair run a speed comparison. i.e. they made each do a complicated redraw on CAD-3d I believe. Running at the same speeds (32MHz), the SST redrew in 45 secs what took the TURBO 54 secs. which (off the top of my head) is around 20% faster. Supposedly, the SST auto senses the speed of the DRAMS installed and so it adjusts its wait states accordingly. However, I don't know if either one used/had a co-processor.
Does CAD-3d use the 68881/68882?

This I haven't tried. But, seriously, you bought Creator updates to get
Softlink and Song Chain? I always thought of these things as extra stuff.
I'm in it for the great editing and ease of use. Whatever it takes, I guess.

> So, for $120CDN you get a new manual, but you already know how to use the
> sequenc because you spent weeks with the poor translated original manual,

Brett, if you think you know all of 3.1's editing features from the 2.2
manual, I'm not surprised you feel cheated. You're missing all the best
stuff!

I've had problems with C-Lab's support people myself. But, Jeez, $120 for a
manual? You should at least check out the P_USER part, where it tells you how
to load a song into the buffer automatically and program a run-time switch.
This is how you chain songs, and it works like a charm.

I run CLAB Creator/Notator on my Atari. If it wasn't for Creator/Notator (and of course Calamus) I would not own an Atari. As far as I am concerned, and I have experience with many sequencers on many systems, Creator/Notator is the best all round sequencer/notator package there is and it's only for the Atari (same for Calamus in the DTP world).
I use my computer for music composition and all my promo typesetting, including the j-cards for my cassette tape release. A little 520ST goes a long way (especially with 4meg in it :-)

2767. Gemini installation.

Newsgroup: comp.sys.atari.st
Date: 1991-09-19 13:23:42 UTC
From: chang@cme.nist.gov
Message-ID: <8718@squire.cme.nist.gov>
Source record: 228853

Is there an english installation doc for gemini? I recently
got gemini11.zoo off of a.a and I couldn't get it to work right. I've
deciphered some stuff about order in which to copy the files in one of
the docs, but I haven't had any luck in getting it to work.

Possibly related, I just had my computer shipped back from
Korea (where I was for year) and I'm not sure it's working entirely.
My harddisk is acting a bit flakier than it did after it was shipped
to Korea, and stuff regularly bombs. I haven't quantified the
problem/symptoms, yet, but the following newstuff also give me
problems. UIS III doesn't installfrom auto, I can't get mint to run
from floppy as described in the docs, either auto or from the
desktop., none of the seq files I've down loaded from a.a work. Seems
Shadow of the Beast (brand new) doesn't boot right, goes past the the
eldritch cat part, can hear violent change of tracks form disk drive
and then some varied colors on the screen. like some of the symptoms
may be memory related, could it be the shipping back and forth has
zonked out some of the 256K chips in my machine. Is there a way to
check that they are all ok.

The machine is a 1040stf (circa 87 I think) and I've only had
it back from Korea since last thursday. Any ideas anyone.

2768. .au <=> .snd conversions -- How?

Newsgroup: comp.sys.atari.st
Date: 1991-09-19 13:48:49 UTC
From: bcc@Eyring.COM
Message-ID: <1991Sep19.134849.3777@Eyring.COM>
Source record: 228854

I now have a Sun-4 workstation to use, with a built in audio capability. Does anyone know how my .snd files (remac/replay format) can be converted to play on the Sun-4 (.au format). Or, I am supposed to be able to record sound on the Sun -- does anyone know how to convert these sounds to .snd format? I found a pair of programs that were supposed to convert Iff to Law format, and back, but running the conversion on a simple .snd file resulted in something just barely recognizeable on the Sun.
This ranks fairly low on the importance scale, but it would be nice...

>
>(Read it and weep people, the only defensive message I will make, it wasn't
> even all that defensive really, just a factual comparison. The closest
> I will EVER get to supporting Atari.)

I agree, Dave Small is smarter than that. I'm sure he is working on a MEGA STe version. Personally, with all the problems I've been hearing about the new Atari systems, I'm still glad I have a Mega (I just had the fatal Power Supply problem myself, what a pain...) I've had a number of problems (trust me). My drive shielding is so poor that I had to wrap the drive cable in aluminum foil, as well as the drive itself...

Anyway, I'm considering going to a TT (even though it has lots of problems too), and would like to know a couple things:

1) How well does the Spectre GCR work with it?

2) Where can I get a BIGSCREEN color card for it, not this crappy 640*480*16colors (16 colors? come on Atari....). I need at least 1024*768*16colors like my ISAAC, or better yet 256 colors from a 16million palette).

3) Has anyone used Calamus SL in conjuction with a High-Rez card on the TT?

4) How is the keyboard? Will my Mega Keyboard work with the TT (just in case the TT keyboard sucks)?

5) Where can I get one cheapest?

Message-ID: <1991Sep19.142747.29286@spss.com>
Source record: 228857

I use Tiger Cub and a 1040ST w/ 2 floppies for sequencing and software development. I love it! I compared the ST to PCs, Macs and Amigas back about five years ago and decided it was the best for my goals:

68000 assembler learning tool
Music sequencing tool

and I have been pleased since.

My question: does anyone know of any way to get Tiger Cub to send out system exclusive messages? I've found that it will if I convert a MIDI Recording Studio file up to Cub format, but that is really painful (unfortunately, since I at that time used relatively slow clocks for my sequences, like 24-96 spm). If anyone has any ideas, please let me know via e-mail to bobhays@spss.com.

2771. Mega STe Keyboard

Newsgroup: comp.sys.atari.st
Date: 1991-09-19 14:40:58 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1991Sep19.144058.11532@magnus.acs.ohio-state.edu>
Source record: 228856

I still say the the Mega STe keyboard stinks. I do LOTS of typing, and I like the MEGA keyboard ok, but hate the Mega STe keyboard with a passion. So do most of the people I've talked to. I do know one guy who likes it though, so I guess it is just a matter of how your hands work (mine are big and clumsy, so I like the oversized keys on my Mega)...

Anyway...

Is the TT keyboard really the same as the MEGA STe keyboard? I heard differently, but that was probably a year ago, and things change...

- What ever happened to free love anyway? -

Same here. When it came time to move on from my QX1 hardware sequencer, I spent months shopping for sequencing software. Creator won it, no contest, so I had to get it. And I was QUITE relieved to find that the computer it runs on was the cheapest variety I had seen. (Bought a Mega 2 ST)

> As far as I am concerned, and I have experience with many sequencers on

> world).

I agree. That's why I put up with C-Lab's release schedule bullshit. They never know when the next version's coming out, but that's typical of the Atari world. So I've got no real gripes.

The one that did not work right ? don't talk about lharc. I have had
much trouble with this assembler-optimized lharc versions (not UNIX-
compatible etc) - finally, I've got the UNIX-Lharc-source and compiled
it using GCC. At least that worked!
As a result, I have now switched to ZOO2.1 which does not have such
problems. I have the version that was posted in comp.binaries.atari.st
(which is the OK version). It should be available from atari.archive or
at least from any comp.binaries.atari.st archive site.
I hope that we will stay at the present, stable version of ZOO2.1
without zillions of different versions with slight optimizations and
modifications appearing soon.

From: rost@rgb.dec.com
Message-ID: <1991Sep19.170237.12983@ryn.mro4.dec.com>
Source record: 228884

I'm interested in getting a 24 pin dot matrix printer to use with my STs, and am very interested in the Panasonic 1123. There are no local Atari dealers (what else is new) and the ones I called on the phone were unsure if the 1223 can do screen dumps, as it is Epson LQ compatible, rather than Epson LX (9 pin) compatible. I'm not worried about my programs that have printer drivers, as they all have drivers for the LQ series, but I have some children's software that does graphic screen dumps to let my kids print out their pictures, and I'm not about to have TWO printers in the house.

So what I wanna know is...if anybody has an 1123, 1124 or 1124i, can you do screen dumps to it?

From: data3d@aahs.no
Message-ID: <"855*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228870

Since I posted my last message about the tos 2.05 loader/booter, I've been getting lots of response, some positive, some negative. Some even claimed that the program was illegal, which it most certainly isn't.

The program was written in an attempt to load the tos 2.05 from a disk in a fashion similar to the many tos loaders that appear with every new tos release. This _has_ happened a few times, so it cannot have gone completely unnoticed by.

The program can be very useful when trying out new patches, enhancements etc. The ability to load and run TOS 2.05 is merely a bieffect, and I won't be held responsible for any abuse of this program.

Does anyone care to comment whether I should upload the program to atari-archive, or let it lie in rest on my harddisk?

2781. GEM/MC trouble...

Newsgroup: comp.sys.atari.st
Date: 1991-09-19 17:49:31 UTC
From: data3d@aahs.no
Message-ID: <"856*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS>
Source record: 228871

I've been trying to write an small accessory which involves some form handling. I'll have to admit this is my first approach to GEM with machinecode, so anything could be wrong.

Anyway, the action goes something like this:

Growbox
Form is drawn
The user interacts
Form is closed
Shrinkbox

And this is where the fun starts. Now the windows behind the box is supposed to be redrawn. They aren't. Instead they are redrawn when I put the _next_ form on the screen. Wiping out my new form.

The fact that removing the grow/shrinkbox effect makes the problem even larger doesn't help very much.

Has anyone experienced something like it?

You don't want to convert sounds this way if at all possible. Converting
from uLaw to .snd usually yields very bad samples. It's much more
productive to go the other route: sample on an Atari or Mac and then
convert to .au format. In either case, you can find conversion
programs on atari.arhive:

atari/sound/convert/st2sparc.doc .snd -> .au (source)
atari/sound/players/digistuf.arc .au->.snd (and other stuff)

> to its quality are appreciated.

I've had one for almost 3 years now, and except for the internal speaker never working. (And me not getting around to get it worked on). It has never given me any trouble. I've used it with my old 800XL, my ST, and am currently using it with an Apple IIgs at work. (It has both a DB25 port and a SIO port for use with the old 8-bits.)

Too bad its not 2400 baud though...

p.s. It also looks a lot like the box to control the SLM805 laser printer, and the XEP80 80 column adapter for the old 8-bits. Atari must really like reusing the same cases for different projects. The card reader for the portfolio for use with PC's looks just like my XM301 modem from my XL!)

In article <0B5H91w164w@cellar.UUCP> darling@cellar.UUCP (Thomas Darling) writes:
>> The new version is fine except that I bought it for one particular feature
>> - song chain. This new feature apparently doesn;t work. CLAB said 'Oh
>> well'. Great. Assholes.
>Uh, Brett...it works on my machine. You might have incompatible hardware or
>some odd TSR kicking around. Some things have been known to interfere with
>Creator's timing.

CLAB-USA said they couldn't get it to work either. They FAXed Germany,
CLAB-Centraal, and it was reported that PUSER_20 was buggy. Are you sure you
are using v3.0; they fixed it in v3.1.

>> store copy and sure enough the SOFTLINK feature doesn;t work - it won;t
>> continue to play the sequencer when you switch partitions - useless.
>This I haven't tried. But, seriously, you bought Creator updates to get
>Softlink and Song Chain? I always thought of these things as extra stuff.
>I'm in it for the great editing and ease of use. Whatever it takes, I guess.

Uh, i am hardly ignorant of Creators features. I have put it about
1600 hours on Creator. I was perfectly satisfied with the v2.2 but I had
an impending gig and the song-link feature would have been very nice. So,
at the last minute I splurged the $80 and got a bum upgrade (nice *belated*
manual though). I use Cretor because it is the smoothest sequencer on the
planet. I hardly use any of its detailed features.

>Brett, if you think you know all of 3.1's editing features from the 2.2
>manual, I'm not surprised you feel cheated. You're missing all the best
>stuff!

I know all of 3.1 editing features from the 3.1 manual. The 2.2
manual was discarded long ago. I feel cheated because I expect software
perfection for the $400 + $120 I spent on the package. If I have to pay
money for an update I better well get new *working* features and have old
bugs fixed; not with Creator.

>I've had problems with C-Lab's support people myself. But, Jeez, $120 for a
>manual? You should at least check out the P_USER part, where it tells you how
>to load a song into the buffer automatically and program a run-time switch.
>This is how you chain songs, and it works like a charm.

Apparently not in v3.0. v3.1 works... mostly.

Source record: 228889

I used to be heavily involved in the Atari world, but have been out of touch for quite a while. What is the going rate for a new bare-bones color ST system with one double sided drive? (I have a very specific use in mind.) Please respond via email.

|> try to type on a Sparcstation keyboard??
|>

Yes, and like it quite a lot. I guess what we need to realize is that everyone has a different ideal keyboard. Most of us agree it isn't the original ST keyboard, though....

2791. Re: Mega Keyboard on old ST (Was- Re: Question about SST board from GBS

Newsgroup: comp.sys.atari.st
Date: 1991-09-19 22:03:52 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <QcqFv8G00VE444H3kV@andrew.cmu.edu>
Source record: 228859

Here is how to patch a Mega keyboard to an old ST:

DETACHABLE ATARI KEYBOARD MODIFICATION:

I've got a detached keyboard - A Mega keyboard, for that matter -
attached
to the 520 I'm using now. It's a trivially simple modification, if
you're
willing to do some wire fitting. What you need is a 6-wire telephone
jack
and a 17-pin single inline header plug (plus, of course, a Mega
keyboard
and a 520 - dunno about the newer ones, but the older (no internal
flopsies)
520's are happy with this modification.)

4 simple steps, with appropriate cursing relative to success.

1: take apart the 520, remove the old keyboard, leap on it a few times,
tear apart your warranty (leaping on the 520 keyboard provided
incentive
to do the modification properly, tearing apart the warranty just
saves
the people at Atari the effort...)

2: take the telephone jack (er, socket, or whatever - I bought a 6-pin
wall plug and ripped it apart) and run the wires to the header plug
as follows:
blue, yellow -> pin 1
white, black -> pin 13
green -> pin 14
red -> pin 15

(my notes - I can't look at the actual connector for obvious reasons
-
say that the blue wire is #1, yellow #2, white #5, black #6, green
#3
and red #4 on the telephone jack or socket or whatever)

3: plug the header plug back into the 520 at the same place you took
out
the old keyboard. (Pin one is towards the front of the unit, in
case
it's not labeled on the PC board.) feed the un-keyboarded end of
the

Mega keyboard cable through the RF shield where the 520 cable went
in,
then reassemble the whole mess.

4: plug in in and play. You'll have to relocate the mouse cable out to the Mega keyboard from the ST itself, but that's the only difference I've noticed.

Total cost? 1 mega keyboard plus about $6 for the bits. And it's trivially simple, and it doesn't permanently modify _any_ of the offending bits except for the telephone jack and the the 17-pin header plug. I'm noted for my tendency to kill hardware by a glance, but I've managed to rip apart the ST, attach this mod, and put it all back together with no ill-effects so far. (But I guess I'll haveta point out that you're on your own if you do this; I'm not responsible in general, and it'd be inconsistant if I made an exception in this case.)

Hope this helps.

2792. Re: ARJ?

> you done it? :-) I'd really like to go to 4M one of these days...

I don't think the older ST that are causing the Problem, the problem
MMU's where fitted to the later machines and have this Part No. C0 100109-001

So it could be a good idea to check over the wiring etc, and did you
fit the anty ring resistor ?, in the extra address line.

In article <"856*.S=data3d.O=aahs.PRMD=uninett.ADMD=..C=no."@MHS> data3d@aahs.no (Karl Anders 0ygard) writes:
}Anyway, the action goes something like this:
}
}Growbox
}Form is drawn
}The user interacts
}Form is closed
}Shrinkbox
}
}And this is where the fun starts. Now the windows behind the box is supposed
}to be redrawn. They aren't. Instead they are redrawn when I put the _next_
}form on the screen. Wiping out my new form.
}
Before you draw the Growbox, you should have a:

form_dial(FMD_START, 0,0,0,0, dial_x, dial_y, dial_w, dial_h);

to lock that portion of the screen. Do a form_dial(FMD_FINISH, etc...)
when you're done. That'll convince GEM to redraw.

If this still doesn't work, do an :

evnt_mesag() so GEM has time to let the WM_REDRAW message get to all of the
open windows. Then open your next form.

Hope that helps...

I read an article earlier, caught the tail end of it, by a person
who said that s/he was putting the Atari ST into an AT case. I am wondering
if anyone else has tried this and what the results were and what you need to
do for this to work. I would also like to do this but am unsure where to
begin, so any help would be appreciated. Please post messages or maybe even
e-mail them directly to me if no-one else wants to hear about it. Thank you.

And also on the TT.

MiNT works on the ST, STe, TT, and Mega STe. Some minor contortions
are necessary for the latter two (i.e. MiNT has to be started from the
desktop instead of from an AUTO folder); these contortions will be
done away with in the next version (0.9) of MiNT.

I'd be thankful if anybody could help me out with this: There are two points defining a line in the area (-long,-long),(long,long). I need anything outside the area (-short,-short),(short,short) clipped off, while preserving the slope of the line. I'm absolutely lousy at math and anybody who can point me in the direction of a solution would save me a sackful of grief. (Grief is measured in sackfuls. Frustration comes in bales and anger in pecks. Stupid emotional measurements come in threes.)

Thanks for any help...

2806. Re: Any Panasonic 1123/1124 Owners Out There?

Newsgroup: comp.sys.atari.st
Date: 1991-09-20 10:52:31 UTC
From: r0mill01@ULKYVX.BITNET
Message-ID: <1991Sep20.105231.5631@vlsi.louisville.edu>
Source record: 228890

I've done screen dumps with my 1124 in Proprinter mode but only if the control panel is resident. The dumps are slow and seem to miss lines or leave gaps now and again.

2807. Earlier monitor questions

Newsgroup: comp.sys.atari.st
Date: 1991-09-20 10:57:19 UTC
From: r0mill01@ULKYVX.BITNET
Message-ID: <1991Sep20.105719.5737@vlsi.louisville.edu>
Source record: 228891
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks to all those who answered my earlier queries about monitors for the ST. It looks as though my best best for sharpness and high resolution for less than $1000.00 is to use a 640x400 res mono monitor on my vintage ST. Now I have new questions:

1. Is the Atari monochrome my best option, i.e. is its sharpness as good as I can expect from any monochrome in the <$1000.00 price range?
2. What are some other paper-white monos in the $200.00 - 500.00 range that are better?

Beta Testing

A note to those who offered to beta test my hypertext text editor--please send me a snail mail address so I can mail you some DSDD disks with the program and utilities. I have no FTP or GEnie access, so snail mail is the best option. Reply directly to the header address or try one of the following.

Isn't this rather the same type of rumour as was flying about when the STe was about to be launched. All the magazines reported that the new STe was going to have features such as better graphics resolutions, 16MHz processor etc, (i.e. what the Atari user community wanted from the new machine), rather than what Atari was likely to put in the new machine.

When we all saw what the enhancements to the STe actually were, I think most Atarians were disappointed. I feel that this disappointment was the start of the decline of the ST in the UK. From the magazine "guesses" about the new STe, I wouldn't be surprised if some people held back from buying a ST until the STe actually came out. When it didn't have the Amiga beating features it was expected to have they probably bought a different machine (a diplomatic description or what :-)). I also felt that the time was rife for an upgraded ST machine, and perhaps if Atari had got the STe right (i.e with enhanced features that existing owners would want), then there might have been a lot of STe sales from exisining users wanting to upgrade.

All the above IHMO of course.
;-)

In article <1991Sep20.002033.3641@actrix.gen.nz> Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:
}I don't think the older ST that are causing the Problem, the problem
}MMU's where fitted to the later machines and have this Part No. C0 100109-001
}
}So it could be a good idea to check over the wiring etc, and did you
}fit the anty ring resistor ?, in the extra address line.

Yep, we made _sure_ we had everything wired in properly before we started banging our heads against the desk... Is the MMU with No. C0 100109-001 the bad one, or a newer one?

To restate my problem a little more clearly:

I have an old 1040STf with 2.5M due to a Z*RAM upgrade. The Z*RAM has put 2M in bank 1, leaving bank 0 at .5M... I bought some SIMMs, my friend wired them in properly as a 2M bank 0, and it wouldn't work at all.

So we took them to my friend's old 1040STf. He tried to wire them in as bank 0. Wouldn't work. So he wires them in as bank 1 (essentially giving him the same setup as me, but with SIMMs instead of a Z*RAM card) and it works properly.

Neither of us could put 2M into bank 0. When the SIMMs were wired up in bank 0, we removed the top address line, essentially fooling the ST into thinking they were 256k SIMMs... We booted, and it thought it had 512k in bank 0, no problem. The SIMMs are fine, and our STs are fine. We assume it's some weird "feature" of an older MMU.

Looking in his parts catalogue, we fine an ST/Mega MMU with part number X (I didn't write it down, and the book's at his house). A little later in the book, we find a Mega MMU, with a different part number.

Has anyone gotten an old 1985 (whether stock or modified) 1040STf to take 4M or RAM? Should we spring for either of the new MMUs to see if that'll fix our problems? Should we start looking for a cheap Mega 4?

Sorry, there will never exists a MF version 2.9!
It's now at 2.7 and the version number will convert to e.

> >cs-tex:
>
> Christoph Strunk has ported full TeX 3.1 and Metafont 2.9 using Laser C
> (As I remember).

As I remember he has used GNU CC.

> It's a complete set with a small but useful installation-
> program. CS has made some arbitrary modifications to the TeX macros, so
> that the output may look a bit different from original versions,

Sorry again, he has made modifications to TeX macros (it's the
`german.sty' macros) and he has modified the CM fonts!!!!

Please: do not use these tfm-files, unpack the original tfm-files.
They should be in a separate lharc archive called `tfm_ori.lzh'.

It's also unnecessary to change the macros in `german.sty'.
If the umlaut characters in your TeX output hang below the baseline,
if you are using the original `german.sty'...
... it's *not* `german.sty', it's your incorrect dvi driver!

> >passautex:
>
> I know of an Amiga version of TeX named PasTeX, this should be that one.

It's a fault of the persons maintaining the `rusinfo' ftp archive.
PasTeX (for the Amiga) and br-TeX (my version for the ST) uses the
same sources for initex/virtex.

From: mami@opal.cs.tu-berlin.de
Message-ID: <4846@curie.cs.tu-berlin.de>
Source record: 228885

Grueazi everybody !

I recently downloaded the program DCRUNREZ.PRG from a.a. What I understood from their description
is, that I can run any program no matter of the screen resolution my monitor has.

So I tried it out and had no success. DCRUNREZ.PRG didn't run any program beside the one with
the extension .PR3 which would mean to run it in high resolution.

I have an STe and the normal SM124 mono monitor.

Did I misunderstand anything ?

Did anyone else succeed in working with this program meaning what did I wrong ?

Ciao,
Manfred

>
>The fact that removing the grow/shrinkbox effect makes the problem even
>larger doesn't help very much.
>
>Has anyone experienced something like it?
>
I think the solution is to add 2 more lines in your code:
1. **Before** drawing the grow-box do a
'form_dial(FMD_START, 0,0,0,0, dlg_x, dlg_y, dlg_w, dlg_h)'

This is supposed to reserve screen for your dialog.

2. **After** drawing the shrink-box do a
'form_dial(FMD_FINISH, 0,0,0,0, dlg_x, dlg_y, dlg_w, dlg_h)'

This frees screen space, AND sends a REDRAW message

(the values of the constants FMD_START and FMD_FINISH
are 0 and 3 respectively)

2819. ANSI/vt100 emulator posted

Newsgroup: comp.sys.atari.st
Date: 1991-09-20 17:33:51 UTC
From: rosenkra@convex.com
Message-ID: <1991Sep20.173351.15170@convex.com>
Source record: 228804

i have just uploaded an ANSI/vt100 emulator, with source, i wrote
recently. well, it is almost ansi/vt100 (doesn't do scroll regions).
it should handle most of the commands in a normal vt100 termcap
and all the commands in a pessimistic ANSI termcap. it also switches
the system font (uses line A to find the font header) so that it
recognizes bold, underline, and reverse graphics modes. sorry, no
blinking mode. with that, i have only included fonts for monochrome.
no fancy stuff, but there is a shell escape. executable included.

look for file t100.zoo (zoo 2.1 archive) at atari.archive.

Well, since demos are often hacked directly to the hardware, this isn't exactly surprising. The STE does have more capable video hardware, which incidentally happens to fall over some unfortunate code that depends on the older hardware.

Some applications inevitably break with an upgrade to the OS. Either the application will be fixed, or you could install an older OS version from disk (or by using a ROMswitch) for braindead compatibility.

>
My feeling of this is that you NEED (i never read you did) to remove or
at least deactivate the 256K Chips , which normaly reside in BANK 0
In the case you forgot that, the hardware gets into VERY big Trouble when
reading from the rams at an Address greater than 512K. If you leave the
HIGH Address line unconnected (MAD10 i think) the system reads and writes
into the same bytes, which shouldn't make any Problems.

I somehow lost the beginning of this discussion, so if this was already
done please excuse me.

Bye
Wolfgang

This is where you misunderstand.

DC Run Rez is not an all-in-one any resolution emulator that emulates the correct resolution and runs a program at the same time.

DC Run Rez _is_ a program that will switch resolutions before executing a program, however, the program must be able to run on the type of monitor and system you are using.

In other words, if you only have monochrome, you can't run a low rez game with DC Run Rez.

Sorry for the confusion...

I've just finished sending the latest program of the week to the usual places
(atari.archive.umich.edu ftp site and comp.binaries.atari.st moderated news).

DC PopBar our most popular program of the week has been updated!

This is a new version of DC PopBar, the DA that gives you a popup menu of
the GEM desktop menubar. This version is _much_ improved. Download this
and see why this is our #1 most popular desk accessory (now even better!).

ST and STe ONLY. Not for the NewDesk desktop. 1.6x and below. 100% assembly.

Jambo netters,

I'd like to get few facts & opinnions on following:

Having a TT030/8 and considering buying a CALAMUS SL (you know 16.4 million col.

-What choices do I have in monitors... I want a big one (at least 19")
-How many coclors do they display ?
-what kind of triks do they do to the TOS ? which of them CAL.SL supports ?
- any hints, tips, or things to avoid ?

-anything that's mental as anything or not will help !!!

THANKS !

How do you do this (temporarily)? I have an old nearly-original 520 (with modulator, without floppy) that has a half-populated Tech Specialties piggyback board. I'd like to bring it up to 4MB, since chips are practically free these days, but to do so I need to disable bank 0. I'd like to do that without having to get a bunch of chips desoldered -- in case it doesn't work and I have to restore the original setup.

2835. Re: Question about SST board from GBS

Newsgroup: comp.sys.atari.st
Date: 1991-09-21 14:51:49 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1991Sep21.145149.24269@oz.plymouth.edu>
Source record: 228747

[A couple of different(?) questions about the SST board from GBS.]
If I don't get a TT I'll be moving my STf into another case so that's
not a problem. What I'd like to know is.....

1. What does the SST do for monitors ? Will my stock mono SM124 work
with it ? Or is there a way to use the slot(?) I heard mentioned
(by someone) for a card for a "REAL" monitor ?

2. Will the SST work with Minix ? (Someone (the(?) person who did the
ST port I think), whose name I can't spell (Frans Meulenbroeks ?)
{sorry!!!} has said they are working on a TT port of Minix ?! so
I assume that's the version I'd start with ?)

3. What happens to the RAM in the ST ? Does the SST board use it for
anything ??

4. Where can I get the e-mail/mailing address of GBS ? I'd like to get
a spec sheet on the SST.

Thanx for any/all help...

-Andy-

I have a slight problem whenever I try printing something when I use
1st Word. It form feeds a page of paper before it starts printing, and
therefore wastes a lot of paper unnecessarily.
I am using a Epson LX-800 printer but am using a Epson LX-80 printer driver
for 1st Word. I tried looking at the printer driver file but cannot seem to
find where it messes up. If anyone else uses this setup or know how to
correct it, could you send me a message or post it?

2837. Mega/STE Screen Shifting

Newsgroup: comp.sys.atari.st
Date: 1991-09-21 16:34:19 UTC
From: au036@cleveland.Freenet.Edu
Message-ID: <1991Sep21.163419.16634@usenet.ins.cwru.edu>
Source record: 228817

I have Mega/STe that with certain programs (such as 1stprint or Lucasfilm games) will cause the screen to be shifted to the right with what should be displayed on the right side of the screen being displayed on the left (somtimes in a distorted mirror image). This only happens in Monochrome.

In color, certain programs (such as the mvngpxls demo) cause the screen to flicker after execution.

I have seen these problems on two machines. Has anyone else seen these promlems? Does anyone have a Mega/Ste that functions correctly? Is there a fix for this problem? (The machine is still under warranty)

That is the one thing we didn't do... I wouldn't let him take out the
chips until we had the SIMMs working...

BUT, I don't think it makes a difference, really... In bank 1, my Z*RAM
was used instead of the chips (which were only taken out about a week
before we tried to set up the SIMMs) for at least 6 months... And the SIMMs
are working fine as his bank 1 with the original chips still installed...

Hmmm, maybe we should borrow some SIMMs and try that...

2839. Accelerators for the ST forsale

Newsgroup: comp.sys.atari.st
Date: 1991-09-21 22:37:36 UTC
From: stevef@bug.UUCP
Message-ID: <823@bug.UUCP>
Source record: 228832
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have come to possess a large number of Processor Accelerators for the 520, 1040, and Mega ST that I will sell for $65 each shipping included (add $5 for shipping outside the U.S.). I will sell two for $100. These are new units, in the box, were built by CMI and are fully tested. These accelerators are on multilayer boards that plug into a socket you solder onto the 68000. These boards are built around a 16 MHz 68000 and run at double the standard processor speed. The speed up you get with this product depends on the software you are running, but it runs from 10 to 30%.

These boards (there is a different one for the 520/Mega or 1040, so let me know what you want) also accept 68881 floating point unit of any speed, although it doesn't pay to get one faster than 16 MHz. For software that uses the math chip you can get speed ups of eight to ten times or more.

There is also a socket for an Atari blitter chip if your machine didn't come with one. You can get these from your Atari dealer.

These boards originally sold for around $300. Schematics and PAL equations are available on request. Complete instructions are included. DON'T try to install one of these if you are not handy with a soldering iron and haven't done this kind of thing before! I will not be liable for your mistakes.

If you want one of these, call or send a check to:

There are 3 Lines which need to be disconnected to the old chips and
also to be set to a certain Level (Are they High or low activ, if High active
tie them via a 1Kohm Resistor to GND and if activ low tie them via a resistor
same type to +5V) The Lines are CAS0H CAS0L RAS0. You need those for the
SIMMS, and normaly there are resistors via which CAS0H and CAS0L are connected
so there is an easy way to re/connect them if nescassary.. RAS0 (also RAS1)
has no resistor to use for this kind of thing, BUT it shoulb be running OK
without disconnecting RAS0, becasue only in conjunction with the CAS lines
the RAMS get selected and selects the specific BITS, it will refresh those
old 256K Rams but that should't cause any Problems, except for the
loading the MMU (depends on the builddate .. I think the oldest are the
ones which are capable of accepting the MOST load..

Bye
Wolfgang

I think this information is in the FAQ for this newsgroup, but since I
can't find the article (expired, I guess), here goes ...

You need:

gcclib - library files
gccinc - include files
gccbin - executables

It's also helpful to get the GNU utils (especially if the linker
gcc-ld.ttp is not in gccbin!)

Also, your environment should be set up some thing like the following:

setenv GNUINC c:\usr\include
setenv GXXINC c:\usr\include.g++
setenv GNULIB c:\usr\lib
setenv GCCEXEC c:\usr\lib\gcc-

The GXXINC environment variable specifies the include files directory
for GNU C++ (g++). GNUINC is for the C include files and GNULIB is
for the library (.olb, crt0.o) files. GCCEXEC is the path and prefix
of the compiler intermediate executables, such as gcc-cpp.ttp (C
pre-processor), gcc-cc1.ttp (C compiler proper), etc.

The best one I have seen is Memfile, by the same guy that did Neodesk. It is PD or Shareware, and available via ftp from atari.archive.umich.edu. It is a memory/file/sector editor.

There was also a really neat German pd or shareware program, but it did not like my Neodesk installed font.

Derek M (the author of STXFormer, the software 8-bit emulator) has stated that
he is/was working on a software ST emulator for 80xx6 platforms. The
"Gemulator" can supposedly blow an ST out of the water on a 486. I have not
heard a followup on this for some time (I read about it in Current Notes
some months ago). This should be interesting if it ever appears . . . .

>to EDSI [sic] adapter if such a beast.

Yes, there is such a thing as an ESDI to SCSI adapter. My company uses the
Emulex MD-23 ESDI-SCSI controllers. Each MD-23 allows up to four ESDI drives
to be accessed from the SCSI bus. One nice benefit of this approach is that
the four ESDI drives share just one SCSI ID (they have different SCSI LUNs).
Theoretically, one could hook up 28 ESDI drives to your system this way.

In theory, this should work. However, I have never attempted to use an MD-23
to hook an ESDI drive to an ST.

>How do you do this (temporarily)? I have an old nearly-original 520 (with
>modulator, without floppy) that has a half-populated Tech Specialties

You do not have to remove the 16 256k drams to deactivate them.
To put the chips into a low power standby mode you put CAS0 and CAS1 high.
This is easily accomplished:
1) locate resistors R135 and R136
2) desolder the left lead from each resistor from the main board
- this is the left lead with the board oriented component-side
up, with the connectors furthest from you.
3) connect the desoldered leads to +5V (pin 8 of the memory chips)
If the 520 doesn't have R136 and R136, you can disable the memory row
by putting RAS high. Cut the trace leading from pin 8 of U15 (RAS on MMU)
to pin 4 of U16 (sometimes U17). connect pin 4 of U16 to +5V.

2849. Re: Mega/STE Screen Shifting

Newsgroup: comp.sys.atari.st
Date: 1991-09-22 11:55:23 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.685540523.larserio@kvart.ifi.uio.no>
Source record: 228834

The last weeks several people having the same trouble with their
new MEGA STE has asked me how we fixed mine, and I hope this file
can help you fix it. It's really the best machine Atari has made
so it would be terrible not to have it in perfect condition :-)

Errors on DMA-sound and video on MEGA STE - HOW WE FIXED IT !
"""

Here's a summary of what we found at service in Norway.
First - the errors on both machines we discovered were:

- Static/noise on DMA sound and MIXed standard ST sound.
- Sync-problems when using Spectrum512 pictures (vertical bars).
- Vertical flickering bars on monochrome (most at 8 MHz).
- Right edge of monochrome screen "flips" over to left edge
when changing screen adress/resolution in mono-mode.

We tried to find a chip that could be the cause of all these
problems and found a big VLSI chip partly hidden under the right
edge of the VME-card holder. It's chip U502 on my MEGA STE and
is called GSTSHIFTER on the print-layout. After looking at the
print-layout on both MEGA STE and standard STE we found the same
chip on standard STE, a combined sound/video chip but with a totally
different part-number. Anyway, we removed the original MEGA STE
chip (made in 1990) and replaced in with the STE chip (from 1989)
and all the problems were gone. If you want to "steal" a chip from
a standard STE it's chip U401 inside the STE (still GSTSHIFTER).

Disclaimer: Even though this solved the problems for us it might not
work for all MEGA STE's and you do this at your own risk

(I still would like Atari Corp to give some official information on
this. It's not "ONLY YOUR MACHINE" anymore. It's quite a few...)

Note: I brought a Atati because of its Gem capabilties, very easy to use and learn, but you keep on about CLI, Why do you live in the dark ages.
If I wanted CLI, I would have brought a PC, I am one for things that are easy to use, that is how you get more productivity.
If you what to stay with your Steam Engine, why not go play with it, in the Museum.

What is wrong with Thomas Questers version of Lharc, it is fully compatible with the PC version, and a lot better, plus it supports all the othere LZH/LARC Formats and Unix ones as well, and Note. packs far better than all the otheres, and is blindly fast.

Thomas Questers LZH201E, is now in English, and so are PFX and AFX, AFX is for Data/Text and RSC files, will unpack them, when they

are loaded.
I have tested the Pack option for AFX and found on the 3 RSC files
that I tried, it was some 60% smaller.

PFX will pack programs, and will save a lot of disk space.

Why not get these programs and give them a try, you have nothing to lose,
but some thing to gain, you could even end up using them..:-).
Thas is you use a Atari..

You can do any screen dumps with the Correct printer driver,
but not with the built in driver, only supports 9 pin Epsom
Printers.

Note: here in New Zealand the 1124 came out as a best bye,
but that was too late, I had brought a NEC 2200, and wish I had not,
a piece of plastic junk.

>--
> Matthew Seitz
> seitz@netcom.com

The rags you mentioned are the standard examples give by all
Atari Apologists (AA) (TM by Covert)!! And while they are all
good mags, they are NOT glossy nationally distributed mags which
show up in the big bookstores. they are rags which you have to
hunt to find. SO, novice Atarians wouldn't even know about them.

And someone who is just deciding which type of computer wouldn't even
know about them at all.

So, I don't count those as true mags. The are more hobbyist mags then
real commerical mags. As yourself this: Do any of them PAY for articles?
If the answer is NO (which I am certain is the case) they they are not
commerical magfazines but would be better classified as FANZINES!!.

Now, I just bought the Summer 1991 issue of ATARI EXPLORER which is
sold in at least my local WALDENBOOKS bookstore. But since it is
published by Atari Corporation don't look to see any controversial
articles in it. A captive magazine (like AE) is controlled, and in this
case the TRAMIEL TRIO would never allow anything negative to be published
in it. That would be like buying a magazine published by General Motors,
you have wonder how impartial it would be?

and speaking of CURRENT NOTES, what did you think of Bill Yerger's
Hiostory of the Atari ST? I thought that Bill really exposed Atari's
inner workings for all to see!! Bill probably made a few enemies with
his articles!! I don't supopse you would ever his articles in a fair
and impartial magazine like ATARI EXPLORER :-)

these are the old CMI boartds which have a bad history!! And this guy
keeps reposting this same ad every week or so.

I wouldn't buy one of these on a bet. If you want an accelerator
buy Dave Small's board or Jim Allen's board. Both are supported by
real fine people and you won't get burned. Buy one of these discontinued
unsupported board and you get what you pay for!!

Support the few remaining ST developers!!

> Note: I brought a Atati because of its Gem capabilties, very easy to
> use and learn, but you keep on about CLI, Why do you live in the
> dark ages.

I've written a GEM shell for ZOO.

It works as Bill described -- it translates user preferences into a command tail that is passed to a separate ZOO program.

Either the shell or ZOO can be replaced/ upgraded without requiring a change of the other component.

One thing that became quite clear to me in the process of writing ZOOSHELL is that it's difficult to come up with a visual menu structure that provides access to all of the capabilities of the program in a fashion that doesn't overwhelm the user.

My solution thus far has been simply to forget about being complete. ZOOSHELL provides a simple way to use the most common functions.

ZOO's command-line interface remains available for people who want it. I intend to add a command-line editing option to ZOOSHELL, so users who wish to do so can write complex commands in a GEM dialog.

I don't know of a good, economical, visual way of saying ``move all the .C, .S, .O, .H and .MAK files into an archive, deleting the originals, but leave everything else untouched.'' There's a fairly simple ZOO command for doing that.

> If I wanted CLI, I would have brought a PC, I am one for things
> that are easy to use, that is how you get more productivity.
> If you what to stay with your Steam Engine, why not go play with it,
> in the Museum.

I don't think it's necessary to give up the capabilities of a text shell in order to gain the capabilities of a graphical interface, and I can't buy the argument that the mouse is always easier to use than the keyboard.

That's the design error of the Macintosh -- no shell, no script language, no simple text applications. Original Macs don't even have cursor arrow keys. I hate using them -- you can't even do something as simple as copying a PostScript file to the printer without having a special application.

It's like buying a beautiful pair of new shoes, then walking around
with your shoelaces tied together.

A combination of GEM plus a command-driven shell -- such as GEMINI
with Mupfel -- is much better.

> What is wrong with Thomas Questers version of Lharc, it is fully
> compatible with the PC version, and a lot better, plus it supports

> packs far better than all the otheres, and is blindly fast.

Can you unpack every file created with Quester's program on a Unix
box, a PC or an Amiga? If not, I think the problem is obvious.
Write-only archiving is the curse of the .LZH format.

>dark ages.

first of all, i am NOT saying don't make ARJ use from the desktop impossible. i AM saying don't make ARJ use from a command shell impossible (like using it in scripts or as part of a rule in make). i am not being fascist here. i am not restricting YOUR life. go ahead an use the desktop. go ahead and use ARJ from the desktop.

second, most of us that program the codes you use for free, find it virtually impossible to program from the desktop. it is just not efficient at all. if you write more than 500 lines of code a week you would agree. if you are scratching you head right now wondering what "make" is that i mentioned in the above paragraph, you do not fit in this category.

the "dark ages" are infinitely more productive for programming than the "ultra-modern" GEM desk top. without multitasking windows (which GEM does NOT feature), a robust set of GEM-based tools (none of these, either), the desktop is only ok for running applications. please do not impose on me or scores of other developers your concept of what we should use. don't be a fascist...

> If I wanted CLI, I would have brought a PC, I am one for things
>that are easy to use, that is how you get more productivity.
>If you what to stay with your Steam Engine, why not go play with it,
>in the Museum.

geez, what can i say :-)

have you ever used a $250,000 high-end state-of-the-art workstation or a $25,000,000 supercomputer? i got news for you: they ALL have CLIs for using them. they ALL use unix (with few exceptions like CTSS, LTSS, COS for crays). since when does atari's GEM desktop (which is not even multitasking) better than unix for programming? sheesh.

you are obviously not using the ST the way i do. i WANT the st to look just like my good ol' vt100 screen which i use at work on unix boxes. that means a real unix-like shell. for your information, CLI's are almost always 1) more productive, 2) FAR more versatile, 3) prefered

by programmers. and note that windowing systems on workstations run CLI's in windows. the only difference is that you get more CLI's on the screen at once and can cut and paste between them. it is still a CLI, however. now leave me alone...

the ST is a very nice platform for development because unix utilities port easily and hence make it nice do work like you would on workstations and other unix boxes, even supercomputers.

here is another aspect: how do you list all lines in a file which contain a certain string? you run grep.ttp. but this is not a GEM application so you type in the dialog box its arguments. now how do you find a file named "xxx.dat" on a hard disk? you run find.ttp. but that is not a GEM application either so you type in the dialog box its arguments. keep this up with about 50 other utilities commonly used by programmers and you see that you might as well just enter them on a command line anyway. if you provide me with GEM versions of ALL the utilities i regularly use when programming i might be persuaded to go to the desktop. i also want to do the grep and find AT THE SAME TIME like i can with a CLI (with minix or MiNT). so go ahead and make GEM multitask while you're at it. until then don't make stupid statements like CLI's are from the "dark ages". in fact there is only one desktop approach that comes close to productive use without a CLI and that is probably NeXT. even they offer CLI's, however, since there are IMPORTANT things to do which can't be done (or are not available) with a desktop metaphor. the Mac may have reasonable programming tools as well from its desktop but i don't have a Mac.

and i am a reasonably proficient typist so why should i not use this skill? i spend 75% of my time typing data into a file with an editor. you would too if you were a programmer. so why should i move my hands off the keyboard, slowing me down, if i am spending all my time typing anyway? or do you have access to some system that programs with mouse clicks? if you do, i am sure lots of people would be interested.

i also use my ST to connect to my system at work (which is obviously not GEM based, thank god :-). that means i type. again, no mouse. those of us born before 1970 (1960?) remember typing our programs on cards with key punches. an interactive CLI was like a jump into the 25th century by comparison. the GEM desktop, however, is not. it makes life easy for users but not for programmers (who write the programs users use). why do you want to slow us down and cut the production of programs you need/want/use?

an archiver is probably more important for me because of my 80 MB of hard disk, about 1/3 or more is source code, mostly archived. it has to be solid.

i'll challenge you to a duel: we each write, compile, and execute a significant application, you exclusively from the desktop, me from a CLI. we use the same compiler (say gcc). guess who will get done first? and note that the standard desktop limits the number of args to .ttp programs. i regularly execute programs with 100's of characters on the command line. to go thru a GEM version would mean clicking on scores of buttons to execute say a compiler. and i'd still have to type in file

names anyway (unless the desktop can now read minds :-). to re-execute the same command could mean re-clicking. with a cli i just type "!c" (to execute the last command starting with the letter "c", say the compiler "cc") or equivalent, all without my fingers leaving the keyboard to reach for a mouse.

this is how i use MY st. how you use yours will not in the slighest be impacted by a GEM shell for ARJ. a GEM-only ARJ will severely impact me, however. i don't think you really understand the difference. i have proposed a scheme to allow you to use it the way you want while you are suggesting a scheme where i cannot. what gives you the right and the wisdom to do this? who are you to tell me (and other developers) how we should use our computers? and why should i go out and buy a compiler for $200+ to get an integrated (perhaps GEM) environment when i can get a portable compiler (gcc) for free? and it gets updated far more frequently than say turbo or lattice C. and it is supported by top-notch programmers (esmith and bammi, et al) who understand my needs since theirs are similar. and gcc runs on unix boxes and can generate atari executables. this is not true of borland or lattice compilers as far as i know.

sorry for the vented spleen, but i just get PO'd when i read stuff like this...

>What is wrong with Thomas Questers version of Lharc, it is fully
>compatible with the PC version, and a lot better, plus it supports
>all the othere LZH/LARC Formats and Unix ones as well, and Note.
>packs far better than all the otheres, and is blindly fast.

there is no source available. he also added lh5 format which is not generally available on other platforms. it has also no english docs or screen help (except possibly only very recently tho 2.01c i believe still spits out german with no args - and it has been 20 years since i last read/spoke german [high school]). it is also written in assembler (mostly?) so it will not port to anything else. i even volunteered to thomas to help him port the sucker to unix if he sends me source, but have so far not seen hide nor hair of it (just the executables). if TQ's lharc is so good, then a unix version will help make it universal. then it could port to VMS and MSDOS as well. then TQ will be the lord of lharc :-) as long as he maintains it like rahul dhesi does with zoo.

also, i think i have a version of TQ's lharc which unpacks files with the wrong date, tho i have to double check this (i tested about 10 lharc programs one day and several had this problem, one of which was one of TQ's, i believe). if this IS the case, this is totally unacceptable. i need the date to be exactly the same as it is in the archive since i use tools which only work based on the date of files (e.g. make and RCS). if an archiver can't get this correct, it is absolutely useless, no matter how fast or efficient it is.

unfortunately, if it packs with lh5, you may not be able to unpack it on (say) a unix or VMS system. and believe me, MANY people want to be able

to do this, even if you don't. so tho it can handle any lharc, it itself generates files which are incompatible. and i don't want to spend half of my life figuring out what is the latest version of lharc on 2 or 3 different platforms EACH WEEK.

of all the lharc's out there, TQ's seems to be the most robust, tho it has its problems. there are so many versions out there that for compatibility alone, zoo should get the nod for information exchange on the net. what you do at home is your business. go ahead and lharc everything. just don't shove it down my throat. zoo is centrally supported (like arc) on all platforms. lharc is not. every system (PC, ST, amiga, etc) has its own (incompatible) versions, even on the same system. that, pardon my french, sucks. if you think not, just read some of the pleadings by other people on this net saying "i can't extract <whatever>.lzh with my version of lharc". happens every week. i have every version of lharc i can find on the ST (including 3 or 4 of TQ's programs). this is a huge waste of disk just to satisfy my paranoia that i will be able to extract any .lzh that happens my way. in contrast, i have but 2 arc (arc 5.21 and 6.02) and 1 zoo (zoo 2.1). i can extract ANY non-corrupt .arc or .zoo with these (and in the case of zoo, with fiz i can often extract parts of corrupt files). this is not possible with lharc either (as far as i know).

zoo 2.1 gives about the same compression ratio as lharc. and i know it won't get screwed up too badly by 16 people trying to "improve" it. and it will probably be optimized fairly soon so that it runs like tuned lharc version. personally, i'd sacrifice 2x the speed (on compression) just to get the compatibility.

how many times do we have to go thru this? lharc should be banned, no matter how "blindingly fast" or how tiny it makes files. that is not the issue at all...

>PFX will pack programs, and will save a lot of disk space.

pfx is nice. i do use it on occasion. i plan to use it more now that i have switched form alcyon to gcc (compilers). gcc tend to make larger executables. and if TQ would mail me source to pfx (so i don't have to disassemble it) i will even send him a shareware contribution (hint, hint, thomas :-).

2856. Atari.archive monthly posting

Newsgroup: comp.sys.atari.st
Date: 1991-09-22 19:52:47 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Sep22.195247.6991@terminator.cc.umich.edu>
Source record: 228704

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.
[Changes from month to month are marked with a * for easier reading]

1: How do I use BART?
Use bart by mailing atari@atari.archive.umich.edu and using the word
"help" as the body of the message. This *should* send you a help file.
If you have read the help file, and still have questions, please send
them to jon@atari.archive.umich.edu, not me.

2: How can I connect via FTP?
If you are interested in ftp, I recently wrote a beginner's guide. Please
mail me and I will send you a copy. I'll post it every once in a while too.
It's also available in the ~atari/admin/Guide.to.ftp file.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8. Be forewarned however,
this may change on a moments notice.

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: What are all the ???s in your index?
The ??? symbol means that I have no clue what this file is. If you know
please drop me a note, but be sure to include what directory the file
is in, etc. Thanks.

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Here's a question for you Jeff, how come I can't use 'ftp terminator.cc.etc'
any more to connect?
That's because you're not using atari.archive.umich.edu like we told you
to. Don't say we didn't warn you......The name of the host
and/or the host itself may change soon.

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo21bin.zoo : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh172.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

* Please don't archive anything for uploading in arc6.02, unless you want
to provide me with the unix sources for it. I didn't think you
wanted to ..... HOWEVER, I'd be happy to accept zoo2.1 uploads.

Thanks to everyone who has uploaded anything lately.....

* Interesting things this month:

1. The other umich archives are starting to gain popularity. You may
want to check them out. They are located at archive.umich.edu. All
except the atari archive are housed there.

BART PROBLEMS:
* There haven't been many lately. Things seem to be moving smoothly.
There was no down time for BART in the past month.

* Once again, BART problems go to JON, not ME.

PLEASE NOTE: FTP service is a privelege, not a right! Please make
a supreme effort to keep heavy FTP use in off-time hours (i.e. after
5 pm EST but before 8 am EST), or else you will be shot. (We mean it).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

In this day and age when you can buy a 1040ST for $399, I find this kind of
silly. Especially considering that the machine's main pro market, MIDI users,
wouldn't be supported by such emulation.

Source record: 228708

I am very new tothe Atari ST club. I bought the thing for a smart terminal and
was pleasently surprised that the thing is quite a capible machine.. As a res
ult, I am looking for the following applications so I can play with it..
-
Is there a plot program for the MONOCHROME Atari st that will graph 3-D math fu
nctions? (Like polar, parametric and 2-variable polars, etc...) Is there a sh
are ware version of this I may FTP to myself?
-
Is there a Word processor (I already have New Word) that will generate fonts on
an Epson Printer.. (Like a Mac does with an Imagewriter)..
-
Oh yes: and a question about the Atari "SM124" Monochrome monitor: I have a sm
all break in the cable which occasionally causes a disruption in the tube.. Is
it possible to replace the cable without replacing the CRT controller? Does a
nyone know a source for parts?
-
Replies? U43610@uicvm.uic.edu

They would probably look a bit more professional looking if they
would simply dump the crappy ST DTP software they use to make the
mag with. PM 4.0/MS WORD 4.0 make a great combination and a
much more capable feature list to make DTP easier and more fun to do.

Plus you can run it on your ST!

Lordy, Richard is right, if your going to buy any type of performance
upgrade, I would seriously consider Mr. Small,

Besides he needs our support to provide the itsy bitsy teeny weeny Atari
community in the USA with quality high performance hardware, that is
right for the budget, and a lot nicer than the alternative, ie TT.

So write out your check to your local hero...Dave Small. The ultimate Atari
user.

OK?

Anymore goop about the SST boards and when they are going to be shipping?

Anyone out there he anything??

I am just itching to blow 1500 bucks.

Gosh let me see...Mmmm, 030-40 Mhz, floating point support, 12Megs of
Memory, 8 Megs of Z wait state ram, system 7.0 support...

TURN ME ON BABY!

Sorry...

You really can't get around the desoldering part (I certainly can't
get in close enough to snip just the Vss and Vdd pins - If _you_ can, then do
that and just resolder them when you are done). You can however do what I
did which is to desolder all 16 256k drams and then solder in 16 low-profile
dram sockets (like $.50 a piece at Radio Shack - I know, I got ripped, but
they were near-by and ...). That way, you can mess around with the address/
data/WE/CE/whatever lines by using <insert appropriate probe-like device - hey,
I used old 64k chips with the power pins snipped off, except on the ones where
I needed the power pins, in which case I left the pin on, but never got Vss
and Vdd from the same chip>. Then, when/if you are done hacking, you just
put in 16 brand new (and more importantly lower-power-consuming) drams and
viola! All back to where you were before. Just gotta watch out for where
you swing that soldering iron...

2864. Assorted Atari queries

Newsgroup: comp.sys.atari.st
Date: 1991-09-23 02:15:34 UTC
From: rjung@girtab.usc.edu
Message-ID: <19897@chaph.usc.edu>
Source record: 228705

A few assorted Atari STe computer questions out there. For the record, I am running a (brand new!) 4 megabyte 520STe with TOS 1.62 installed and a color monitor.

1. Does anyone know for sure whether or not FSM GDOS works with existing GDOS applications? The official word from Atari (via Atari Explorer) magazine says it does, but I am a tad suspect. My dealer says that a program must be written for FSM GDOS to work properly. My biggest GDOS application is WordUp, and if I can get a way to squeeze tons of fonts out of it without having to fill up my hard drive with bitmapped fonts, that would be terrific.

2. Speaking of WordUp, should I be moving on to another document processor program? WordUp offers me a lot of terrific features -- WHEN it works. WordUp is also showing to be very sensitive with new programs out here, such as MultiGEM. I'd like to go to a program that offers a similar "word processing mixed with image layout" program. I'm not sure I want to go to full DTP a la Calamus or PageStream. I hear WordFlair II is good, but how does it handle for just writing text?

3. Speaking of MultiGEM, is anyone else using this product? It's running very nicely for me so far (except for older "breaks the rules" programs), but I have one gripe with it. Whenever I change resolutions, I lose all my accessories! Is this a known bug? Does anyone else have this problem? Is an upgrade available?

4. Speaking of MultiGEM again, I am a tad annoyed with the MULTIWIN.PRG that's included with the package. It's supposed to channel I/O from .TOS and .TTP programs into a window, so I can multitask .TOS and .TTP programs. Only thing is, in medium resolution, MULTIWIN.PRG is running my .TOS and .TTP output at an 11-point System font. Yuck! Is there a solution or workaround for this? Maybe some other PD/Shareware "Put TOS output into a GEM window" program I can use?

Any comments or advice would be appreciated. Thanks!

> Plus you can run it on your ST!

There's nothing wrong with the DTP software used to produce these
magazines. The limiting factors are:

-- The output devices. Typesetting a magazine on a 300dpi laser
printer isn't going to yield professional-quality output
regardless of the software used to place the text on the page.
Some ST magazines (and ``fanzines'' is probably a good description)
can't afford any better, sad to say.

-- The output font technology, especially PageStream 1.8's fonts.
(Version 2.1 uses Compugraphic fonts, and the quality is quite
good.)

-- The printing technology. AtariUser is printed on newsprint using
a high-speed web press, then folded, stapled, cut and trimmed
by people who were (to put it kindly) casual about their approach
to their jobs. The management obviously has decided to use cheap
printing methods in an effort to stay in business. Given that
requirement, it looks about as good as it could.

I just looked through the September and October issues of AtariUser. It
obviously is typeset using a laser film imagesetter, not an laser
xerographic printer -- the letterforms are competently rendered. Neither
the layout nor the typesetting would be better had they been performed
with PageMaker.

>sequences have to be slowed down, etc?

Cad 3D works fine with my Mega STe.
I don't know about Master Tracks Pro, but I can say that Notator runs just fine at 16Mhz (NO CACHE!!!!!---the program will NOT work if cache is turned on). The only thing that works faster about Notator is the processing time (transform, process, record assimilation etc). The tempo is still the same. And no, everything is NOT transposed up one octave.

Most of my old PD programs do NOT work with my new Mega Ste. I've been told that any program that did not strictly follow the Atari programming guidelines and 'cheated' will probably not work with the new 2.01 MegaSte TOS.

1 meg main system memory
Internal 720K 3.5" disk drive
TOS 1.4 Operating System ROMs
Atari standard mouse (Japan)

Atari SC 1224 Color monitor $225
Original super-sharp JVC model

Semi-"Home-brew" hard drive $200
SH 204 case and power supply/fan
ICD Advantage Host Adapter (w/clock)
OMTI SCSI-to-MFM converter
Seagate ST-251 40 meg drive (flakey)
DMA cable

Surreal Systems Internal Clock (w/software) B/O

Abacus Chartpak B/O

If you have a trade in mind, then go ahead and ask. For now,
I am looking for mostly IBM and generic stuff: SCSI Hard drives,
laser printers, Roland MT-32 or LAPC-1, etc...

Anyway, if you have an offer, then make it! The worst thing
that can happen is that I'll say "No way!"

I prefer email, but if you would rather call, you can reach
me at (301) 521-0015.

Thanks!

I discovered a bug in 3.1. In graphic edit mode, I was mouse-clicking
a note length value and the little rectangle (representing the note) would
move to an entirely stupid location along the time axis. The note location
value didn't change and neither did it really change when I heard it play--
just the graphic representation. If I scrolled beyond the point and then back
again, the note would appear in the correct position, of course until I changed
the length value----then it would shift to a stupid position again.

Next time I booted up, I couldn't get it to do it. Somebody out there with
a similar experience?? I mean, I'm damn sure it wasn't a dream.

Atari has been ``doomed'' for years, but they still make computers.
Fortunately, I use a computer and don't sell advertising.

> Maybe they too have given up on the product. It would appear so form the
> fact that I have seen one mail order catalog advertise Atari modems (1200)
> SX212 for sale for $19.99 each. It seems that Atari must have dumped
> them on this low price seller for REALLY low prices. What's up, will we see
> $150 ST's next?

If I could pick up a few STEs for $150, I'd be stuffing some big Christmas
stockings this season. :-)

The SX212 is being dumped through Damart because 1200bps modems no longer
have any real market value. I paid $39 for a 1200 modem two years ago. I
paid $25 for a 1200 pocket modem a year ago. $19 is no surprise. The 9600
V.32 modems are going to hit the $200-$300 bracket in the next 12 months.
If I had a warehouse full of 212s, I'd drop 'em fast.

The market makes computer companies do strange things. Back before Tramiel
took over, Atari dumped a load of game cartridges into a landfill and ran
over them with a bulldozer rather than let them get into an already
depressed market.

As long as you guys have got me thinking about prices and looking through
catalogs, here are currently advertised mail-order prices (all U.S.
vendors and U.S. dollars):

```
Systems Price Comments
------- ----- --------
520STFM 325 sorry, no SIMMS

Ferenc,

Weird. I've never seen such a thing. Sorry I can't help you. The only thing
I can think of would be overlapping identical notes: If you have multiples
of the exact same note, on the exact same MIDI channel, and they overlap each
other (maybe you merged two tracks; I dunno), sometimes the intermixed note-
ons and note-offs will create a bit of confusion.

But, like I said, weird.

Message-ID: <3317@cod.NOSC.MIL>
Source record: 228713

I have an old 1040STf (1986) that I upgraded to 4 megs using the JRI SIMM board. The only "problem" I had is that you have to remove the top of the video shifter can and now you can see some noise on the monitor when the data bus is chugging. When I get motivated to open it up again (or is that if?) I'm going to put some shielding over the top of the video shifter can to fix this, but it's not enough of a problem to motivate me.

Of course, this was done by putting the SIMMS on a separate board.

2884. MEGA STE ROMs on MEGA ST

Newsgroup: comp.sys.atari.st
Date: 1991-09-23 16:33:45 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991Sep23.163345.17105@informatik.uni-erlangen.de>
Source record: 228714

Hi folks,

I've seen a couple of questions about fitting Mega STE ROMs into a Mega ST.
Here's a description how to add extra ROM space to a Mega, at the same adress
where it's in the STE. It can be used for ROM-Disks or even be booted from.
The TOS2.05 will NOT run with this little hack, because the Mega doesn't have
the STE's hardware. Maybe somebody can patch the 2.05, then I don't see why
it couldn't run on Megas with this hack.

Although Mega and Mega STE have 256K ROM space, the Mega uses only the first 192K,
leaving 64K unused. That's because the top 64K are used for all the I/O
chips. So the OS-ROM was moved from $FC0000 to $E00000 leaving enough
space for expansion. To fit a 256K ROM into a Mega, adress lines A20-A23
must be decoded to generate a chip-select. To make the CPU recognize the
new ROM, a DTACK signal has to be generated, too. The diode (1N4148)
makes the DTACK open collector. The /CS signal goes to the ROM /CS input,
if you use an EPROM, tie /OE and /CS together. On Reset, the Mega will still
boot from the old TOS, however. If it is to boot from the new ROMs at adress
$E00000, remove the old OS-ROMs, and connect their /CS signal (or use GLUE's
select for the lowest ROM) to the boot input, otherwise tie that input high.

The chips are a 74LS00 and 74LS30. They fit on a small circuit board,
and you can get the supply voltage from any TTL chip in the Mega.
All lines (except VCC , /CS and "boot_input") can be soldered to the CPU
directly, or via the connector.

If EPROMS are used instead of the OS-ROM, they don`t fit into the 28 pin
sockets. The pinout is slightly different, too. You might want to use a
32 pin socket (for the EPROM) and plug it into a 28 pin socket and cut the
appropriate pins on the top socket instead of the EPROM (makes programming them
a hassle ;-) then do the rewiring (ROM has an address line on the pin where the
EPROM has a select line). If anyone is interested in this, I can post how
to do this.

I have no argument with cli's (love my Suns), but I do spend a lot of time in GEM also. I just wanted to mention that there is an acc available at atari.archive that lets you do grep/ff from the desktop - it's called datei sucher (data seeker auf Deutsch I think). I forget the name of the archive but this is what comes up on the acc menu. It can make your non-cli moments a little easier. Yes it's in German but it seems pretty straightforward (maybe I'm missing some advanced features).

It was faster than the TT on some applications, but not on others. Of course, the SST is (supposedly) 100 percent compatable with ST software, which the TT is not. As the GBS rep said, too, the TT and the SST are two different machines with different strengths which can't be measured by speed alone.

But for pure number crunching, the SST looks pretty quick.

>Sigh. Ever heard of MIDI, Mike?

2 or 3 years ago (Hell, maybe even one!), I would have agreed with this.
Atari was (and is to a lesser extent now) THE machine to own for MIDI
use. The built in ports (but not MIDI thru) and a wealth of relatively
inexpensive software made it very attractive for this and many professionals
use Ataris exclusively.

Well, that has changed. There are now many more MIDI adaptors and a lot
of software available for the Mac and PC clones. Recently, I had the chance
to talk to the local MIDI guru at Mannys in Manhattan (buying new guitar)
and he told me that while he still sells an occasional ST for MIDI most people
are buying Macs now. This is coming from one of the biggest music stores
in Manhattan and they USED TO sell lots of STs. If Atari is starting to
bog down in that market too, then what else is there?

Regards,

Chris

Source record: 228715

I agree with Bill and Steve...GEM-based interfaces are fancier and "easier"
to use....BUT the command-line is MUCH MUCH MORE powerful (especially when
you do programming, as Bill mentioned)...it really saves time.

IMHO the command line is meant for advanced users, while the GEM interface
makes life easier for newcomers. Of course, the best of all is a combination
of these two (as Steve mantioned), and this is the reason Gemini is a
permanent auto-start program in my booting partition - yes, I've paid my
registration fee 8*) -

e.g. IMHO it's easier (and faster) to type:
ls *.o *.bak
or cp *.c *.h d:\
than invoking the corresponding commands using the mouse
in a graphic-shell like Gemini or Neodesk.

On the other hand, it is convenient to have visual contact with
almost all the operations and/or commands that are available to
you at all times...and that's the strongest point of a GUI.
BUT once you are familiar with the commands, CLI is defenitly
more (much more) efficient (MHO)

Just my 2 cents...

Most of my PD-program works on my MEGA STE
Even Cubase (MIDI-program) works (but you must be in 8 MHz no cache at start due to the key in the cartridge port). If you patch out the code that checks the key (I've tried this too) it works in 16 MHz with cache (if only Steinberg could fix the code so the key worked on 16 MHz cards too or find another copy-protection...)

Am I write in assuming that if I get the source of the gnu-ST
(sounds kinda nifty, I wonder if RMS would go for it) compilers, build
them on my sparc, that I can cross compile code for the ST by
specifying "-target ST" or whatever target it would be.

Has anyone else done this? Can I patch our existing compiler,
or do I have to rebuild the whole compiler (I haven't really looked
that deep into it yet).

Also, where can I find unix sources for zoo, or does gnu-ST
exist in tar format somewhere

Thanx

Fo

1) Spectre GCR works well on the TT (according to Dave Small), but only when it works at all. It seems about 70% of TT's have cartridge ports which are enough out of spec that Spectre doesn't work with them.

2) The TT keyboard is not bad, it's not as good as most PC and terminal keyboards, but it's a lot better than some PC keyboards and infinitly better than the ST keyboard!

I hope this is helpful.

Steve

For a friend who wants to get into MIDI cheaply:

Wanted: 1 stock Atari 1040ST with monochrome monitor and mouse.
Nothing else required: no extra hardware or software. Preferably from
somebody on the east coast; but for the right price she'll buy from
anywhere. If you've got one, quote us a price, please. Please
specify who pays shipping.

Reply to mrgnstrn@nexus.yorku.ca.

Thanks.

If you could talk to Jwahar Bammi he could answer your questions.

I believe that Jwahar tests new version of GNU sw on a UNIX computer (not
sure which kind) and cross compiles the GNU C source code for the ST. So,
it is possible to cross compile the GNU SW and generate ST TOS/TTP files
on a UNIX machine.

which SPARC machine are you using? I am still deciding which machine to get
to replace my cranky old Mega ST2+2. I am undecided as to whether to buy a SPARC
1+ (or SPARC clone) with SUN's OPen look, or to buy a Mac IIci/FX with AUX.

I really need a UNIX machine with MOTIF, which isn't the native (primary)
interface on the SPARC. Do you use MOTIF on your SPARC?

Well, anyway, yes is it possible to cross compile the GNU sw and generate
TOS/TTP files.

Good luck!!

2900. Re: Any Panasonic 1123/1124 Owners Out There?

Newsgroup: comp.sys.atari.st
Date: 1991-09-24 00:18:03 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440172@hplsla.HP.COM>
Source record: 228603

```
| Keywords:printers
| Summary:Will it do screen dumps?
|
| I'm interested in getting a 24 pin dot matrix printer to use with my STs, and
| am very interested in the Panasonic 1123. There are no local Atari dealers
| (what else is new) and the ones I called on the phone were unsure if the 1223
| can do screen dumps, as it is Epson LQ compatible, rather than Epson LX (9 pin)
| compatible. I'm not worried about my programs that have printer drivers, as
| they all have drivers for the LQ series, but I have some children's software
| that does graphic screen dumps to let my kids print out their pictures, and I'm
| not about to have TWO printers in the house.
|
| So what I wanna know is...if anybody has an 1123, 1124 or 1124i, can you do
| screen dumps to it?
|
| Brian Rost @rgb.dec.com
|
```

There are several public domain programs that run in the AUTO folder that allow LQ800 compatibles such as the KXP1124 to do screen dumps. The best I've tried is called SCRDMP24 and it is by Gribnif. It allows you set scale factors to your liking and even halt a screen dump in progress. But it does take a long time and is very noisy! I hardly ever do it. If I did, I would consider a nice new DeskJet 500, :-).

I got SCRDMP24 off GEnie but it may be in the atari archive. Sorry, but right now I haven't the time to post it!

The C0 100109-001 is the faulty one, the good ones are C0 25912-38 or 38A, I did see a article on Ram upgrades, it could be the one at achives, or the one on GEnie, but the funny thing was the Author stated that you could not have 2 megs in bank 0, but does not state why, The internals book quotes that MMU settings..

My machine has the C0 25912-38A MMU, and I have 2 megs in bank 0, and 1/2 meg in bank 1...

>How about an ST emulator card which would fit into a slot of a PC clone. So I
>could run old ST software and clone software without having computers take
>over the house!

Yes, why emalate CGA graphics on a slow ST when you can run ST software on a
Super VGA.

GEMULATOR (Son of Xformer!) is in the works and I hope to have it ready by
next summer. It is a 68000 emulator for 386/486/ based PCs. My latest
benchmarks of the 68000 emulator are giving me .3 MIPS on a 386/20 and
.9 MIPS on a 486/33. In other works, 900,000 68000 instructions can be
emulated on a 486/33 per second. An 8 MHz 68000 can at best execute
2 million instructions per second, but that's an ideal number. Typically,
most software executes at about .5 MIPS. So you can see that software-only
emulation can be done on a 486 or a fast 386 can be done at real time.

GEMULATOR is a 32-bit protect mode program, so it cannot run on a 286 or
8086. If you need any more info, send me private email.

2903. Looking for STMIDIEX.LZH or MIDIEXCL.LZH!!!

Newsgroup: comp.sys.atari.st
Date: 1991-09-24 00:59:55 UTC
From: mrose@csws9.ic.sunysb.edu
Message-ID: <1991Sep24.005955.5825@sbcs.sunysb.edu>
Source record: 228737

Hiya!!!

Well, once again I am posting to see if anyone has the above
program. It is called STMIDIEX or MIDIEXCL.LZH. It was mentioned in
ZNET Software Shelf #91-34. I really need this program. It will store
system exclusive files from midi devices. If anyone has these programs
or something else that does the same, please E-mail me and let me know
where to find them. Please!!! Please!!! Please!!! Thanks!!!
Also, does anyone know anything about WINXV13.LZH, also mentioned in
ZNET #91-34. It supposedly lets you open up to 127 windows at once, instead
of the limit of seven. Is it any good? Where can I find this too?
Thanks a lot!!!

Sincerely,

Michael Rose

Irrelevant. Nobody needs MIDI THRU on their sequencer.

> inexpensive software made it very attractive for this and many professionals
> use Ataris exclusively.

True, but not to the market specified. The best MIDI programs for the Atari have always been $300+ for sequencers, $100+ for editor/libs. And pros don't settle for built-in MIDI ports exclusively; they get multiple separate out systems like C-Lab's UNITOR. Pros can't make do with only 16 MIDI channels.

> Well, that has changed. There are now many more MIDI adaptors and a lot
> of software available for Mac and PC clones.

Well, the Mac, Amiga, and IBM are really competing for the hobbyist market, the person who already owns a computer and decides to get into music. In the U.S., there seem to be many Macs in pro studios, but not really any IBMs or Amigas. And for studios with heavy MIDI bandwidth (using simultaneous sync and poly-key pressure, etc.) the Mac is not even an option; the beast will choke and cause all manner of timing nightmares.

For whatever reason, only the Atari seems able to cope with severely jammed MIDI data in a timely manner.

The Atari has a specific niche in the market. It's not a big niche, but they're all alone in it.

2905. TeX printing to the SLM804

Newsgroup: comp.sys.atari.st
Date: 1991-09-24 01:03:57 UTC
From: cordes@ac.dal.ca
Message-ID: <1991Sep23.220357.1389@ac.dal.ca>
Source record: 228730

I've just tried using flib.ttp (from the showdvi/dviprint package) to make pk-libraries of the pk fonts coming with the SLM804DE/DM dvi-printing stuff. Unfortunately, dviprint then refused to recognize these flib's (whole series of 'font not found' messages). For example, I used flib.ttp to combine all the fonts in the mag___1.000 directory into pk0300, and so on.
Would anybody be able to suggest what might be the problem here? On a related note, I can't get slm804dm.ttp to produce printer output; it would be nice to be able to do TeX printing on the SLM804 without having to run the Diablo driver first.
Thanks for any suggestions.

Well Bill why not give LZH201E a try, it is Now in English, well the one
that I have is, but then it come from Thomas Quester, you could even
find that there is no need for all your Lharcs programs as this supports
all of the lh formats, and that the bugs that you state could have been fixed,
don't you make mistakes..

There is a PC version of lh5 that I have seen, may be some one could
port that,?.

May be Thomas is not into hands off programing, ala C Lang'uage, I am
a bit that way myself being of a Engineering background.

Source record: 228726

I think you will find that lh5 is now supported on the PC,
I don't know about other platforms, and the LZH201E is now in English..

You can now find all these Thomas Quester Programs on GEnie, as I
uploaded them, LZH201_E.LZH, PFX_17E.LZH and AFX_12E.LZH.

Note: they all come with English Doc's, also to fully eXtact all the Doc's
in LZH201E, you type x -rm lharc.ttp , this will eXtract all the Files
that are packed in LZH201E.

In <27843@nntpd.lkg.dec.com>, Bill Powers writes:
>In article <23690@sdcc6.ucsd.edu>, bboychuk@sdcc13.ucsd.edu (The Majestic Llama) writes:

< request for clipping algorithm deleted >

> There is a graphics book written by Foley and VanDam, which contains
>the code to a clipping algorithm. The book would probably be available in
>many libraries.
>

Other books with good clipping algoritms include:

Microcomputer Displays,Graphics, and Animation
Bruce Artwick
Prentice Hall
ISBN 0-13-580226-1

Procedural Elements for Computer Graphics
David F. Rogers
McGraw Hill
ISBN 0-07-053534-5

Also, the Abacus 3d graphics book had a semi-coherant explanation
of clipping, and the code worked fairly well.

No separate port, but the MIDI Thru signal is available on the MIDI Out jack,
you just need a (sigh) non-standard cable to split them out.

>all of the lh formats, and that the bugs that you state could have been fixed,
>don't you make mistakes..

i WILL try it (in fact i think i already have it). however, you did not listen to what i said. what happens to lzh files on the ST is almost irrelevant. i am pretty certain i have enuf versions of lharc to tackle just about any lzh file :-(. however, i do not think there is a single lharc that runs on unix, VMS, MSDOS, PICK (pick?), well, you get the idea. i want my cake and i want to eat it, too. so do many others. that is why we bitch and moan about lharc (not only here, either). there is no standard. period. until there is, i don't want anything to do with it. nor will i use an archiver that does not come with source code. i may not always have an ST and in that case, i want to be able to get at the 100's of MB of files i have on floppies. that means i need to be able to port an archiver to the next platform. lharc may die when the next whiz-bang compressor comes along. personally, i think it did already. i.e. zoo 2.1.

on the other hand, zoo and arc (and even zip) are centrally supported by people that talk to each other. and one person/group generally controls the format of the files, the methods, etc. everything except the implementation itself. even that is done rationally so there is (more or less) ONE set of sources to muck with, not n sets per platform. and a set of rules one must follow to (legally) call it "zoo" or "arc" or "zip" when one ports it to a new platform. read the porting rules for zoo, for example. rahul dhesi knows what he is doing (he developed zoo).

i hope you can understand the huge difference between being able to unarc a file on the ST and being able to arc/unarc it ANYWHERE. THAT is the issue.

>There is a PC version of lh5 that I have seen, may be some one could
>port that,?.

maybe, but only if it is in C. i don't have the stomache for it. i would appreciate TQ's work far more if he would start from this version (say) and keep it in C. to be fair, he probably started on lharc way back when if first appeared (maybe 12-18 months ago). it is not his fault we have this mess. tho the original post (to comp.sources.unix, i think?) was in C. he broke the rules by reprogramming in assembler. further, he has never posted source, so far as i can tell.

>May be Thomas is not into hands off programing, ala C Lang'uage, I am
>a bit that way myself being of a Engineering background.

just what exactly do you mean by "hands off programming"? i suppose
since something is not written in assembler, the programmer is an novice?
actually, i think you have to know lots more to program in C just because
of the rather large runtime library you have to know inside out.

i got news for you (yet again): the entire unix OS (except for a tiny
fraction) is in C. that is 100's of MB of source. it would be totally
impossible to 1) maintain, and 2) port if it were assembler. and the only
reason it has succeeded so well is that it CAN be ported. i think
apollo wrote much of aegis in pascal, another "hands off" language.
and a fair amount of VMS is probably in fortran or bliss or some other
"hands off" language.

lharc is proabaly 0.05 MB of source by comparison. 1000's of times smaller.
you tell me which is more "hands on": controlling hardware directly from
device drivers written in C or taking a (small) C program, compiling
with -S (to get assembler source), then hacking it a bit for speed?
i am sure the latter is what TQ probably did (i would have).

once i wrote a prototype radar signal processor in a weekend (a 50 hour
weekend :-) in C. it would have taken at least a month in assembler and
it would have only run on one machine. choice of language by multilingual
programmers is never based on proficiency. it is always based on expediency
or other issues. many people (myself included, tho i hardly consider
myself all that proficient) can program in assembler. so what? C is capable
of just about anything you can do in assembler anyway, especially on the ST.
of the 100's of 1000's of lines of C i have written in the past few years on
the ST, i was only forced to write a few hundred lines in assembler for one
reason or another. and optimizing compilers can often generate code that
runs nearly as fast as assembler. there is little reason to write in
assembler except when every cycle counts like in (parts of) real time
systems. on the ST that translates to games.

hey, roger...stick to engineering (please!). besides, REAL programmers
wire wrap chips together...:-). only pansies TYPE their programs...

enuf of this. i think i made my points. i am just waiting for an FTP of
8 MB of kerberos to finish...oh...there it is. bye-bye...

I haven't seen this question asked in a while....

One name comes up often, GDT Softworks. I have no experience with them,
but everyone who has dealt with them says nice things about them. They
probably have a driver.

There's Epstart, Printworks, and probably a few more companies which have
discontinued their drivers or gone out of business.

But the one I liked the best was a PD offering. It seemed to be a later
incarnation of Printworks. It did the whole "darker printing" thing
right.

I got it off a server somewhere, I think it was at Stanford.

While we are adding to the list, the Arsenio Hall Show uses an Atari
laptop (I couldn't read the name of the machine because the Atari logo
and the word ATARI was written in big white letters below the amber
screen.)

I also saw an Atari Mega ST in a commercial for some cosmetic or simillar
product.

Anyone else have something to add?

"Hello world. /n"

How can I convert Amiga (IFF) sounds to the .snd - format used by "play" ?

I Tried to load the so-called "raw data" into digiedit and convert it,
but i only ended up with a hard-to-understand-and-very-noisy sample.

Does anybody know how to do it or where to ftp a program that does it ?

searching,
Frank

I heard from a dealer (who had had MEGAs with the problem) that Atari
(scandinavia) was well aware of the problem --- and that it was fixed.
No of new megas the dealer got had this problem. This was around a
month ago.

I don't know what you are talking about, but some of the best looking
ST mags is produced on an ST. The list includes german TOS and the
the brand new danish ST mag 'STT forum'. There is also the DMC show-off
mag. 'Cicero' (??) which started as a seperate mag, but it is now given
away with ST-magazin.

All these mags. are produced on ST/TT with calamus and then photoset.

You need a copy of "Babel". I don't remember what magazine put it out.
Otherwise you can use DigiComposer and load a sample in as "Amiga" and
save it as Atari.

BTW, you can get Digicomposer on atari.archive.umich.edu.
I dunno if they also have babel;I doubt it.

rosenkra@convex.com (William Rosenkranz) writes:
[a lot of stuff about how programming is more productive from a CLI,
[and about how we want to take his CLI away from him.

Just as you aren't saying don't make ARJ use from the desktop impossible
(wow, TRIPLE negative! My 8th grade English teacher would be shocked),
I'm saying PLEASE include a GEM UI in ARJ *along with the command line
options*.

Nobody wants to take your CLI away from you, nor do we want to force
you to use the desktop for programming. That is not the issue here.
The reason I posted my original request is that the number one
complaint about archive programs which I hear from users
(and yes, I listen to a lot of users, and not just here on Usenet, either)
is that these programs are way too hard to learn and use because of the
bewildering array of switches and options. A lot of users, you'd
probably be amazed to know how many, wonder what TTP programs are doing
in TOS in the first place.

Please, it's not that hard to make a program do double duty as a GEM
program with menus and windows and icons and as a CLI program with a
bewildering set of confusing switches that you have to look up every
time you want to use the program for something different.

I like to encourage programmers to make their programs easier for the
majority of users to use, because that makes the ST a better machine.
Obviously, with special purpose tools like programming tools, which
won't be used by most users, the user interface can be as nonexistent
as the programmers will put up with.

For a general-purpose tool like an archiver, it's important that a lot
of people will be able to use it by double clicking on its icon from
the desktop, looking up the options in the menus, performing familiar
operations in windows and dialogs. Graphical shells are nice as far
as they go, but that's just one more level of indirection, and one
more thing for the user to have to know (where did I put that archive
program, anyways...).

Keep it simple. Put it in one program, with an embedded resource
file, and make it work graphically from the desktop, or textually
from a shell.

Am I asking too much? I don't think so.
Do I want to have my cake and eat it as well? You bet I do.

|The reason we want ARC, ZMODEM, LHARC etc as TOS programs is that you can't
|use a GEM program inside lets say a BBS or an automatic comm-program

Wrong.
It's possible (and eminently desirable, if you ask me) to write programs
like this which work both textually from a command line and graphically
from the desktop. It's not even very hard.

Reading this thread, I'm wondering where this idea came from. Why is it
that y'all think that if a program uses GEM it's unthinkable for the
same program to work with arguments from a CLI?

Source record: 228607

Does anyone have the Calamus SL demo and willing to upload it to atari.archive?

From Z*Net 91-40:
SOFT-LOGIK GIVING USER GROUPS PAGESTREAM
Atari user groups can get two copies of the desktop publisher PageStream 2.1, plus another demo copy for their library. The groups are urged to raffle one copy off, use the other for production of their newsletter, and offer the demo version for any member who wants to see more. A related program will offer discounts for user group members when they buy PageStream from dealers. The groups should send written requests to Soft-Logik, 11131 S. Towne Square, St. Louis, MO 63123.

I called them at 1-800-829-8608 (1-314-894-8608). The offer is available also to Canadian user groups and they request that you send them the current and previous issue of your club newsletter (plus put them on the mailing list).

Does anyone know of an FTP site with EPS clip-art? GEM? IMG? CVG?
Other clip-art? (I'm not interested in GIFs.)

Is anyone associated with the Chicago show on the net?
If so, I would like to know about confirmed exhibitors and seminars.
(How far is the mall with the mono-rail from the show? 8-)

|[Super long discussion on the merits of CLIs for programming, etc.]

On the subject of ARJ port for the ST. I have a simple request:

- Either include the GEM interface as Ken Badertscher has asked
for (you know, CLI version that when it is run from the desktop
will present a GEM interface..)

or

- Make the source to your port available so that someone like myself
or Ken Badertscher can do the GEM version ourselves.

Last point.. Programmers use CLIs. Users don't. Well, Atari users don't
anyway :-)

Hi.
I am looking for a PD or shareware desktop publishing program.
I think there is/was one called easytext, but I'm not sure. Am
I right and where can I find it? Thanks a lot for the help!

This is my first attempt to post anything on the net. Please bear with me if you don't see this - and if you do bear with me anyway :-)

Where do I find information on CPX module programming? Are there any public information available or do you have to pay $300 or so to get the docs from Atari Corp?

If you know the answers to my problems please leave them here or even better mail me. Thanx!

Yeah. I went to the dreadful Berklee College of Music, which was the same deal. The reason is this: educational discounts. At Berklee we ended up with a LOT of utter crap - Macs, Performer, Kurzweil 250's (!) - because it was extremely cheap for the school.

So far, the ST has been the most appealing to the serious pro user. I guess Atari feels that since there's no competition there, they don't need to advertise. I don't agree with them.

> Yes, I know Atari "owns" the MIDI market... but someone seems to have
> forgotten to tell everyone else.

I've noticed that the U.S. is a bit behind the rest of the world in this respect. I wouldn't worry about it. I don't really care how many Ataris are sold as long as the user base remains large enough that the software houses keep developing for it, and the best MIDI software is still Atari-exclusive. So far, that has been the case, and it looks like it will stay that way.

>> Good Reason To Upgrade.
>>

So - that's it! I've been puzzled why CNTRL-C does not work on my
Mega ST-4 when I give it as an input to Cconin() - whereas it DOES work if
I compile the SAME program on my STE (by the way I use MWC version 3.0.6).

However MWC's gets() function seems to respond correctly to CNTRL-C
on the older TOSes whereas my own "gets()" function (which uses Cconin())
does not - but is OK on the STE.

Sorry I missed the begining of this debate - but I would be obliged
if anyone could mail me if they know how to ENABLE CNTRL-C in response to
Cconin() (short of Allen Pratt's sledgehammer solution of upgrading the
TOS - or would he prefer I buy a new Mega STE?)

Sincerely, W. Alan B. Evans

It's good to see that Atari is trying to continue to build its reputation as one of the foremost computers on the market for MIDI music.

BTW, if you wish to get a subscription to the MACE Newsletter, just send $10 US to:

Roy Barr, Editor
780 Dove Point Drive
Orangeburg, SC 29115

They also make mention that the CDAR505 will be shipped in September, and FSM GDOS will be shipped around Oct. 1 (I'll believe it when I see it!). Unfortunately for the CDAR505, "it won't even work on an ST machine as shipped. Instead of having the ACSI/DMA port and a SCSI port as announced, it will have only the 'pure SCSI' port that is the industry standard. It'll plug right into a TT or a MAC, or any computer that has a SCSI host adaptor. So ST owners will need to use an ICD or other host unit to access the CD player."

2938. MEGA STE Screen Problem Solved??????

Newsgroup: comp.sys.atari.st
Date: 1991-09-25 12:52:37 UTC
From: johnj@echo.philips.nl
Message-ID: <1991Sep25.125237.10390@echo.philips.nl>
Source record: 228625

I have been a happy ST user for years and I (still)
see the MEGA STE as a very good upgrade of it.

So, in May or June this year I bought my MEGA STE,
and the first thing i noticed was the screen
shifting problem. I reported it to the net.
I got a lot of 'me too' reactions.
So we all know that this is a general MEGA STE problem.

Thanks to LarsErik we all know all(?) the symptoms
and what the actual wrong chip is.

Now what did I do:

First I tried to convince my local dealer that it
indeed is a problem. Unfortunality, all MEGA STEs
he had in stock had the same screen shifting problem.

He called Atari in the Netherlands (called 'Atari Benelux')
and they denied the problem and said that it 'was the
software being not compatible with the new TOS'.
That was in June (I think).

Then summer came, stil working happy with my new MEGA STE
except for that screen shifting problem that shows up
in some programs.

In the end of August I visited the 'Atari Messe' in Dusseldorf
Germany, and to my suprise 'Atari Benelux' was there as well.
I talked about my problem and asked for a solution. We also
talked about the news on the net (as they knew the postings).
I spoke to Wilfred k. Kilwinger (support manager) and
he told me that they were having a meeting in Dusseldorf
with Atari USA to see what could be done to it. (they prefered
a low cost solution like adding caps instead of the costly
chip replacements).

A week later I did ring him to ask of the conclusion
of the meeting. He was very friendly and he told that indeed
there must have been a group of MEGA STE computers which did
have a wrong shifter chip.
An older chip which requires more extra components was placed
on boards which did require the newer chip (which shouldnot
need all these extra electronic components).
He promised me to send a new chip to my local dealer who
could replace it then.

I waited a week, but did not hear anything.
So I first rang my local dealer's technician, but he said
he had not received anything.

So I rang Atari again, but found out that Kilwinger had
left for holiday soon after our phone call (which could have
been the reason for not having sent the chip).
They first conected me to a technician which did not know
the problem at all, but later I was connected to a person
called Honnebeke (or alike). He did knew about the problem
and promised me to send the chip to my local dealer.

So last week, my local dealer had received the chip and I
brought my MEGA STE in. The technician was a fine chap and
I was there when he replaced the chip (after worktime!).
The first thing we looked for was if the chip was labeled
different. It was: one whole letter! That did look promising.

After a real hard work to get the chip out of the socket
(this took more then 20 minutes), he replaced the chip.
After closing the box, the MEGA STE was reconnected and
switched on. Now an application was started and there
it was... the screen shift problem still alive.

My MEGA STE is still not repaired!

So, after four months at least one step has been making
forward: Atari no longer denies the problem.

I hope that the next step will be a good replacement
for the chip.

My shifter chip was labeled:

9101 AMB
C301712-001
(c)ATARI 1990
-31 160608-1

The new one had 'ALB' instead of 'AMB' on the first line.

That's all for now.

john

I forget to say that all people of Atari were very friendly
and tried to be helpful. It is so sory that the problem
is still there.

Oh, you should see CALAMUS SL with the ISAAC card, talk about beautiful!!! (I
got the demo from GEnie).

2940. GEM Font Inquire functions

Newsgroup: comp.sys.atari.st
Date: 1991-09-25 13:58:55 UTC
From: <>
Message-ID: <1991Sep25.135855.14324@vaxc.aud.auc.dk>
Source record: 228630

I've been working on a new terminal program for the ST with the
following specs: GEM based, prog & acc, VT52/ANSI/+FULL+ VT100 with
VT220 subset (DEC compatible fonts included for most languages),
XYZmodem transfer, script files etc.

It will be released as a shareware offer when I've done with the initial
coding.

Currently Term/ST (as it is called) runs on mono ST's only (I wrote my
own screen I/O in the window - standard v_gtext() being is *much* to slow
for high speed modeming) but I expect it to run on most STs later on.
I'll probably make this an option, e.g. one could switch on a special
'compatibility mode' which would make Term/ST use only standard GDOS
fonts. Current I am stuck with an 8x14 font - these enables me to
emulate a 78x24 terminal, adequate for most VT100 editors.

Now, I have some problems which I hope some of you could help me with:

1) Where do I find the number of available fonts within the application?
Their names, ID's etc. - I'd like to present the user with a choice of
fonts to pick from.

2) How do I tell the correct font height (GEM will let me set strange
heights - which make the font appear smeared?!)

3) My application sees AC_CLOSE messages AFTER the desktop has been
taken over by a double clicked .PRG application. Am I doing something
wrong here - I thought AC_CLOSE messages was sent to .ACCs *before*
the Desktop was closed down?

Any help would be appreciated!

>
>
> Is it possible to replace my flakey 1040 drive with a DS/DD 3.5" drive?

Yes indeed.... but be certain it's not the drive cable or something
flakey on the motherboard... (Can't be specific here... I don't know
what exactly goes wrong....) But a "standard drive" can be made to fit,
with case modifications, and sometimes a longer data/control cable.

There are recomendations as to what drives work best, the Toshiba
ND-352 I used worked great after I glued down a "Floppy Detect" switch
in the drive... (Be careful NOT to glue down the write protect detect
switch next to it...)

Other drives may be available that work great out of the box.
Also... watch for a need to twist the data cable.... pin 1 must go to pin 1,
even if you have to put a half twist in the cable... Seems that the
drive originally in my ST had an "inverted" connector on it. A half-twist
in the cable was neccessary with the ND-352.

>Just as you aren't saying don't make ARJ use from the desktop impossible
>(wow, TRIPLE negative! My 8th grade English teacher would be shocked),
>I'm saying PLEASE include a GEM UI in ARJ *along with the command line
>options*.

this is acceptable. however you should have been this precise in your
initial statement which prompted a rather self-centered response from
new zealand and later my vehement tirade :-).

i only see two problems here. first, burrying GEM code in a an application
making it "bisexual", if you will, makes it larger (obviously). bundling
the gem user interface for like programs (all archivers pretty much do
the same thing) in a separate shell seems like a better approach, though
it may make installation slightly more complicated. it is also easier to
tack on GEM support for new programs this way without having to reprogram
each code. the current gem shells are centrally maintained and thus offer
consistent user interfaces (less chance of confusion).

the other problem is that i fear gem code and the application will get
hopelessly intermingled making it impossible to port to non-GEM platforms.
that is assuming source is even distributed.

>Nobody wants to take your CLI away from you

what a relief!!!

>Please, it's not that hard to make a program do double duty as a GEM
>program with menus and windows and icons and as a CLI program with a
>bewildering set of confusing switches that you have to look up every
>time you want to use the program for something different.

i don't find this as a problem but then i CAN see how it would be for
some, maybe many end users. hence my recommendation for a shell.

>I like to encourage programmers to make their programs easier for the
>majority of users to use, because that makes the ST a better machine.

agreed. tho a "majority of users" encompasses a community beyond the ST,
especially for archivers.

also, IF atari plans on ever releasing some flavor of UNIX in the future,
it will be in your best interest to educate users on using CLIs anyway.
it could mean something as simple as an GEM based set of manpages and
better .ttp dialogs. i really don't see a way around CLI use in unix
at some point (i.e. sys admin). who knows, atari might suprise us :-).

>For a general-purpose tool like an archiver, it's important that a lot
>of people will be able to use it by double clicking on its icon from
>the desktop, looking up the options in the menus, performing familiar
>operations in windows and dialogs. Graphical shells are nice as far
>as they go, but that's just one more level of indirection, and one
>more thing for the user to have to know (where did I put that archive
>program, anyways...).

you have to draw the line somewhere. if your installation instructions
are sufficiently clear in the shell, this should not be a problem. most
GEM-only users have no idea what a PATH is so they tend to lump all their
tools in a few places. i know i did way back when i first got my ST. of
course i didn't go for long before i had a CLI (like maybe a week or 2).

>Keep it simple. Put it in one program, with an embedded resource
>file, and make it work graphically from the desktop, or textually
>from a shell.

again, i have no problem IFF the gem code can be totally compartmentalized
in one are. how about something like:

```
% cc -DBISEXUAL ...

#ifdef BISEXUAL
#include "gemmain.c" /* this MUST go before main() */
#endif /*BISEXUAL*/

main (int argc, char *argv[], char *env[])
{
/* "normal" main */
}

/* rest of the application here... any output should go to stdout
as usual */

#ifdef BISEXUAL
#include "gemcode.c" /* this goes at the bottom of the file */
#endif /*BISEXUAL*/
```

put this in gemmain.c:

```
/* this is the first function in the file, BEFORE original main */
main (int argc, char *argv[], char *env[])
{
if (argc < 1) /* or other appropriate test for GEMness */
gem_main ();
else
tos_main (argc, argv, env);
}

/* this will eliminate duplicate main() */
#define main tos_main
```

and have this in gemcode.c:

```
/* put gem-specific includes, globals, etc here...*/

gem_main()
{
/* gem main, including screen hold before exit */
appl_init();
...
appl_exit();
}

/* ALL other GEM code here... */
```

if i do "cc -UBISEXUAL -E ..." i should see the original application. keep tos_main() to be the original code's main program and keep gem_main totally separate. there are probably better ways, tho this should work reasonably well. this is quite "non-intrusive" (adding just 6 lines to a .ttp or .tos application).

comments, ken??? could this be a new standard programming practice? :-)

What I'd be interested in seeing is MINIX running on an SST or TT.
Assuming someone has hacked MINIX to work on a 68030, and maybe even
tried implementing virtual memory, SST + MINIX would be a nice,
powerful, fast, cheap platform.

ken is of course correct. i am not sure i'd buy "eminently desirable" tho.
it is not desirable at all for me, personally.

>Reading this thread, I'm wondering where this idea came from. Why is it
>that y'all think that if a program uses GEM it's unthinkable for the
>same program to work with arguments from a CLI?

unfortunately it came from you. you should have defined "integrated GEM"
in your original post. now that we understand what u meant, it becomes
clear (and reasonably desirable :-). and i get some of the blame for
jumping to conclusions, i s'pose. i was just thinking of the ensuing mess
that would result if all archivers on the ST would become hopelessly
GEM-ized (only) with none of the provisions you point out here.

also, using alcyon, i have NEVER been able to get a gem program to read
args. the few times i tried i got bus errors. maybe the gemstart i wuz
using was hosed or maybe (no it couldn't be!) i made some grievous error.
it is certainly NOT documented in my dev kit (admittedly ancient - 1986).
anyway, i stopped trying. besides, i see the desktop so rarely (just when
i click on my CLI after a boot) i never pursued it any further.

i have officially abandoned alcyon. and i vow to try gcc on this matter...

The upgrade itself hard wires to the back side of the ST mother board, with shielded pads to keep lines going from the MMU and other chips from cross talking to each other. The upgrade requires you to have some soldering skills, but it will not crap out on you like the Aerco or E. Arthur Brown plug in types.

If I remember correctly, STzip does what you are saying. If it is envoked with command line parameters it acts like a .tos prg. Otherwise you get a gem menu-based menu. The gem version of xyz sort of does this in that you can pass it parameters just as you would the tos-based one, but if there are no parameters you are presented with a gem menu. Of course, the display is gem-based in either case (ie: when it shows stats of the d/l or u/l)

Yes folks it can be done... :-)

> making it "bisexual", if you will, makes it larger (obviously). bundling

Not as much as you might think. A decent GEM interface for a simple utility can be built using a few AES library calls. Assuming you don't go hog-wild, a GEM interface need not bloat a program any more than using printf instead of fputs (a common source of code bloat). ZOOSHELL is currently 13991 bytes, but I'll bet that most of its functionality could be wedged into ZOO 2.1 without swelling it up more than 7 or 8K.

Any program with a reasonable structure (i.e., main is used as a top-level flow-control module) should be easy to GEM-ify by adding

```
if (argc == 0)
gem();
```

... at the top of main() and writing a separate GEM module that never returns.

> GEM-only users have no idea what a PATH is so they tend to lump all their
> tools in a few places. i know i did way back when i first got my ST. of

This is a good opener for my own tirade.

I'm griped no end by GEM applications that don't make the best use of the resources that are built into the system, including argument-passing, the environment (especially PATH), and the scrp_ functions. Part of this is Atari's damned fault for not providing a decent manual and environment-setting tools with the system. Part of it is just plain bullheadedness on the part of programmers who won't accept the idea of more than one way of doing things. If they write a mouse-controlled program, then by golly you'd better not have your coffee cup sitting on the mouse pad.

Let me give you an example: Aladdin. It's a wonderful program. It makes GEnie, the online system with the interface only its mother could love, into a pleasant experience. But it's needlessly crippled:

-- You can't communicate with it with command arguments. It has a great script language for automating your sessions, but you have to run it manually because you have to point and click to start a script! This is monumentally silly, since argument-passing is so easy to add to a GEM program. I should be able to launch Aladdin from an event timer for unattended midnight sessions, or from a Gemini/Mupfel script for one-click mail retrieval.

-- It doesn't have enough sense to search for its own files. You have to
be logged into its directory to use it. Environment variables would
avoid this problem.

-- It can't support more than one user. Environment variables, again.

-- It saves cut/paste information to disk as a SCRAP.TXT file, but it
does NOT use the GEM-supported scrp_read and scrp_write routines
to determine where to put the file. This means other programs
(text editors, Gemini, etc.) can't share information with Aladdin
unless they bend to meet Aladdin's usage. That's not right.

Another example is PageStream. It's a fine program and it does what
it's supposed to do, but why in the world doesn't it support arguments?

You ought to be able to install PageStream as a GEM application and
launch it automatically by double-clicking one of its documents (which,
by the way, should NOT be ID'd with the DOC extension that Soft Logik
selected). Hey, folks, this isn't some new GEM feature that came along
with the TT Desktop! ``Install Application'' has been around since the
original disk-based Mushroom TOS.

2955. Unnkulian Unventure II: The Secret of Acme (Now Available!)

Newsgroup: comp.sys.atari.st
Date: 1991-09-25 19:36:22 UTC
From: dmb@wam.umd.edu
Message-ID: <1991Sep25.193622.5166@wam.umd.edu>
Source record: 228632
Cross-posted to:
rec.games.misc,comp.sys.ibm.pc.misc,comp.sys.atari.st,comp.sys.mac.games,rec.games.programmer,rec.arts.int-fiction

(This will look REAL familiar to you Mac folks. But please read
the administrative notes at the end, even if you've already read
the prvevious UU2 announcement. Thanks.)

Unnkulian Unventure II: The Secret of Acme is now available! It's
now a year after the end of Unnkulian Unventure I, and the fame
you garnered by recovering the Orb of Studosity is fading fast.
You have to do something quick, or you'll fade away into permanent
non-entityhood! What happened to the Unnkulians? Why are Acme
products so bad? What is this cheez stuff, really? Your quest
will answer these questions and more!

Unnkulian Unventure II is now available for ftp from the following places:

PC version: msdos.archive.umich.edu: msdos/UPLOADS/uu2v101.zip
Mac version: mac.archive.umich.edu: mac/games/adventure/<long+obvious_name>
Atari version: atari.archive.umich.edu: atari/games/tads/uu2v10*.lzh

The version currently at atari.archive.umich.edu is v1.0, but it
should be updated to v1.01 (which is what the others are) soon.
The copy at msdos.archive.umich.edu will move to its proper home
in msdos/games at some point in the future.

Note to Amiga owners: Nope, there's no Amiga version. (Sorry.)
If you want an Amiga version, you'll have to convince Mike Roberts
(author of TADS, the system with which the Unnkulian series is
written) to make an Amiga version of TADS.

Unnkulian Unventure II is a direct sequel to Unnkulian Unventure I,
so it's advisable (but not required) to play Unventure I before
starting on II. Many things in II will be clearer (and funnier)
if you've played I. Unventure I can be found in the following places:

PC version: msdos.archive.umich.edu or garbo.uwasa.fi
Mac version: mac.archive.umich.edu or sumex-aim.stanford.edu
Atari version: atari.archive.umich.edu

Unnkulian Unventure II is shareware, $10, same as Unventure I. It
is, however, written by a different person (me). Parts III and IV
are in the works -- the message at the end of II is for real!

If you have any questions, problems, &c, please write. (Mac-specific
note should go to nebel@wam.umd.edu; I'll handle the PC and Atari
versions myself.) In particular, please report any bugs you find
so I can fix them before too many people encounter them. :)

ADMINISTRATIVE NOTE: Please post UU2 hint requests and other game discussion to REC.GAMES.MISC, not to rec.games.programmer, rec.arts.int-fiction, or the comp.sys.* groups. Since UU2 runs on three different machines, I think it'll be best to keep discussion all in one group.

[Thanks to Chris Nebel for writing most of the above in his post to comp.sys.mac.games. I've shamelessly borrowed his sterling prose.]

Okay, this begs the obvious question. How?

More specifically, how can my program determine whether it was called from the desktop (or Neodesk/Gemini/etc.) or from a CLI? A first idea might be to assume that if the program received no parameters, it was invoked from the desktop; this doesn't always wash, though (witness 'zoo' when called with no parameters).

Followups to .tech.

2961. Memory upgrade..

Newsgroup: comp.sys.atari.st
Date: 1991-09-25 20:51:15 UTC
From: unknown@disk.uucp
Message-ID: <1991Sep25.205115.7435@disk.uucp>
Source record: 228639

I'm looking for a memory upgrade for my 520ST. I've got one of the
first models with TOS in ROM.. made in '85.. I want to upgrade to 2.5
meg as cheap as possible. Does anyone know of a place that will install
the memory reliably and warranty it for a reasonable time? I've heard
that memory chips are really cheap lately, so I figure now is the best
time to upgrade. I do NOT want the new tos included or anything. I think
Atari has to be crazy to come out with so many new TOS versions and expect
people to pay to upgrade and lose compatibility. Tos 1.0 and 1.2 must
have ten times the software available than the new TOS versions. And how
many TT's are in use in the US? Surely they make up WAY WAY WAY less than
1 percent of computers in use in the US. Getting a memory upgrade will
finally be my final upgrade to this ST, unless Atari starts changing
things fast.
Well, I was posting to check on memory upgrade prices, not to
complain.. If anyone can get me prices and names/numbers, please do.
Also, I'd appreciate if you could just mail them to me. Our newsfeed
isn't that reliable here.

Maybe you should look into 'Flight of the Intruder' by Spectrum Holobyte.
Not only is it of the same high quality as 'Falcon', but it allows the
use of many different controlers as well. Most of these I have never
heard of here in Germany, but it does include a RC for model planes.

Hope this helps,

From: n160ao@tamuts.tamu.edu
Message-ID: <3844@tamsun.TAMU.EDU>
Source record: 228647

In UNIX a tar.Z file is first uncompresses and then un-tared.
Some utilities do both of these for you.

Since I can't seem to get the tar.Z file uncompressed and un-tared and
then into and ARC, LZH, or ZOO file that my ST will read, I need to
get the ST utilities to uncompress and un-tar these files.

What do I need from the atari archive?

GNU-tar? some type of uncompress program? maybe a utility that does
them both?

Thanks
Mark Lehmann

>good mags, they are NOT glossy nationally distributed mags which
>show up in the big bookstores. they are rags which you have to
>hunt to find. SO, novice Atarians wouldn't even know about them.
>

1) If they are "good mags", why do you call them "rags"? To me, "rag" implies
a poor magazine.

2) Personally, I'll take "good mags" over "glossy, nationally distributed mags"
any day of the week. As you point out later, many times the "glossy, nationally
distributed mags" are often little more than cheerleaders.

3) Well, if you were able to hunt enough to buy an Atari ST, I'd think finding
the magazines would be easy. Look on the shelves of the store where you bought
the computer.

Honestly, while I understand the desire for more widespread support for the ST,
I don't see it as a requirement. The ST works and works well, even if its not
advertised. There continues to be new, good software written for it, even if its
not by big name companies. And there continue to be good magazines, even if
they aren't full color glossies, and you can't find them at Walden Books.

Yes, the ST is a hobby computer, with a small cult following by DOS standards.
But that's a far cry from saying the ST is dead or dying. How many people out
there have ever heard of UseNet? How many slick magazines cover RN? But no one
suggests UseNet is dying. In fact, I'd say its booming.

I think there's still room for the ST to continue to live alongside the big
two (DOS and Mac) and alongside it's cousin the Amiga. You may have to look
a little harder to find support, but it's there.

Can't even afford to take the Postscript files down to the local printshop
for 600 dpi or 1200 dpi output before photocopying? I can't believe the
Atari magazines are hurting that badly.

2971. lharc 2.01e vs zoo 2.1: some tests

Newsgroup: comp.sys.atari.st
Date: 1991-09-26 06:45:25 UTC
From: rosenkra@convex.com
Message-ID: <1991Sep26.064525.15427@convex.com>
Source record: 228656

friends-

to help understand the claim that lharc is the best thing since sliced bread, and so much better than zoo 2.1, i ran some tests. this is a rather long post. if you think i am crazy, hit 'n' now. or put me in your kill file :-). if you have an open mind, read on for enlightenment...

summary: zoo 2.1 is just about as fast as lharc 2.01e and makes files about the same size.

rumors dispelled: using assembly language offers huge speed advantages over C in the problem domain of file archivers.

rumors confirmed: C programs compiled with GNU C offer significant advantages (read on...). C programs compiled with GNU C tend to be rather large executables.

tests: 1 archive of archives
2 archive of programs and their docs
3 test wildcard expansion and long command lines
4 handle ^C interrupt

i felt these sorts of tests were important to me. they may or may not be your cup of tea. in that case do your own tests (and report them to the rest of us). missing is a test of predominantly text files. also missing are tests of directory trees and very large files. i've spent far too much time on this already, just to prove a point.

test platform is mega4 (4 MB) 8 Mhz, TOS 1.2, using gulam CLI. environment included TMP=ramdisk and TEMP=ramdisk (i confirmed there was no use of hard disk by observing that no disk access lights went on).

all tests were done with files (executable, data files, and archives) in a 1.5MB ramdisk. this tends to eliminate the effect of partitions which are not empty, differences in drive seek rates, etc. knowing that zoo is sensitive to i/o, i wanted to factor out i/o from the test as much as i could. i did not want to clear an entire partition for this.

versions of each program were as follows:

lharc 2.01e (questor, Assemblerversion vom 14.07.1991)
zoo 2.1 (1991/07/14 22:39:26)

i would call this "equal" technology since the versions were realized on the same dates! zoo was compiled with GNU c (gcc) though i do not know which version. i confirmed this by both "printstk zoo.ttp" which did not fail, listing a reasonable stacksize (16k) and by "strings -10 zoo.ttp" which listed ascii strings that would appear if gcc was the compiler.

it also looks like zoo 2.1 was compiled with MiNT so that it could be
"backgrounded" in a multiprocessing environment. i could be way off base
here, however. i just spotted the string "MiNT" in the .ttp. i saw no
evidence that lharc was equally endowed. it also looks like zoo may support
UNIXMODE tho i don't use it myself. UNIXMODE allows configuration so that
forward slashes "/" can be used in file paths as well as backslash "\".
lharc does not appear to support this either. note that if needed, the
zoo program's stack could be increased with the fixstk utility offered
with GNU C. i do not know how lharc does its memory management nor whether
it would ever need stacksize adjustments. my guess is that memory is
either statically allocated with fixed size arrays or with GEMDOS Malloc.
i would know for sure if source was available. i am unable to ascertain
how much memory lharc Mallocs if it does do so. this can be important
in a multiprocessing environment like MiNT. if it Mallocs all memory,
then no other program could be started until lharc finishes.

commands used:

add files: lharc a lll <files> zoo ah zzz <files>
extract files: lharc x lll zoo -extract zzz
list archive: lharc v lll zoo -list zzz

gulam's time command was used to get the times which are all in seconds
unless otherwise noted.

---
test 1:

used these files for data (chosen at random):

-rw------- 1 u 39071 Sep 22 21:10 f1.zoo
-rw------- 1 u 69918 Jul 23 00:46 f2.zoo
-rw------- 1 u 2303 Sep 4 03:16 f3.h
-rw------- 1 u 74183 Sep 22 21:15 f4.zoo

lharc: add files:

this took 82 seconds to complete, resulting in a file of size 181588 bytes.

lharc: extract files:

this took 27 seconds. HOWEVER, the dates and times of the extracted files
were NOT correct. they were the current date and time NOT the times in
the archive:

-rw------- 1 u 39071 Sep 25 21:56 f1.zoo
-rw------- 1 u 69918 Sep 25 21:56 f2.zoo
-rw------- 1 u 2303 Sep 25 21:56 f3.h
-rw------- 1 u 74183 Sep 25 21:56 f4.zoo

lharc: list files:

LHarc 2.01e (c)Yoshi, Quester, 1988-90.(Assemblerversion vom 14.07.1991)

Listing of archive : 'LLL.LZH'

```

```

---

test 3:

i made a dummy directory with enough files so that the command line length would be longer than 125 chars (which is what Pexec normally can handle). GNU C programs can exploit ARGV extended argument passing (which is sanctioned by atari). gulam can handle this as well with "setenv env_style mw" which i set.

files were:

```
xxxxxxxx.001 xxxxxxxx.004xxxxxxxx.007 xxxxxxxx.010 xxxxxxxx.013
xxxxxxxx.002 xxxxxxxx.005xxxxxxxx.008 xxxxxxxx.011 xxxxxxxx.014
xxxxxxxx.003 xxxxxxxx.006xxxxxxxx.009 xxxxxxxx.012 xxxxxxxx.015
```

with zoo i did:

```
zoo a zzz *
```

and

```
zoo a zzz '*'
```

both worked. that means zoo can handle long lists of file names and wildcards itself.

i tried:

```
lharc a lll *
```

and my system crashed! lharc does NOT handle extended args. and what's more it crashed my system! i did not want to reboot again so i did not test to see if it handles wildcards itself. this is TOTALLY unacceptable.

---

test 4:

i tested each program's ability to be interrupted. during archive creation, i issued a control-C to both. both stopped. however, lharc left a file behind "lharc.)2(" so it does not really handle signals. zoo does since it was compiled with GNU C library (another reason why it is better to use a compiler with a decent library). zoo cleaned up after itself.

---
recap:

create archive extract files comments
time size time

test 1 lharc 82 181588 27 extracted file dates wrong
zoo 93 181865 25

zoo/lharc ratio 1.13 1.0015 0.926

test 2 lharc 63 73820 23 extracted file dates wrong
zoo 74 74183 23

zoo/lharc ratio 1.17 1.0049 1.000

conclusions:

tho hardly an exhaustive test, nevertheless i suspect most tests will show similar results. i am also sure that someone can find an anomoly where either one kicks the pants of the other.

i draw these conclusions:

- lharc is no more "blindingly fast" than zoo 2.1. in fact for extraction it can be SLOWER. extraction is probably used more often by casual users. assembly language lharc is no more than 15% faster on average on compression and at best the same or slower on extraction as the "hands off" C of zoo. in fact given this problem domain (construct a system to compress and store files) it appears that C is an excellent choice over assembler. if lharc was 2 or 3 times faster i would alter this view. but 15% or less is just not enough to warrant the added inflexibility of assembler.

- lharc is not especially better at compressing files. i would hardly call less than 0.5% difference significant. in fact since you don't store bytes on disk, rather clusters, there may be no savings at all on average.

- zoo archives appear to be larger because of the headers are most likely larger for each file. if you examine the sizes of the compressed files, you will note that lharc is 2 bytes smaller than zoo, appearently independent of file size when lh5 compression is used.

- the size of the executables is significantly different. about 2x (lharc being the smaller). however, after packing with pfxpak, zoo is about 53k and lharc is about 28k. the difference is not that significant in a 16 MB partition. what i do find fascinating is that the executable for lharc is itself an archive! this is a really super hack. incidently pfxpak was written by the very same thomas questor who provides the lharc under scrutiny. (and thomas, i DID disassemble it, tho the crash in test 3 wiped it out since i had the source on the ramdisk. maybe you could mail

me the source now...:-). still, i generally dislike self extracting archives though this is a twist on that concept.

- lharc's not getting the dates and times of extracted files correct is unacceptable. PERIOD. if it can't get this correct, it is of no use to me. i need the timestamps preserved because i use tools which depend on the relative difference in timestamps between files (e.g. make and RCS). if this is a case of RTFM, then i will first say "yes, but..." and mention that getting the timestamp right should be the default behavior.

- lharc cannot handle long lists of files. and when you do give it such a list, it crashes the system. this is also nasty, unacceptable behavior. in contrast, zoo can handle extended args and wildcards with ease.

- the version of zoo sources i have can easily be ported to any system with POSIX library and an ANSI C compiler. this includes scores of systems from the PC and ST to supercomputers. lharc cannot (even if i did have the source) since it is written in assembler. note that all assemblers are different on the ST as well so that it might take significant effort to compile it with another assembler, even on the ST.

- tho cute and even helpful, the lharc "thermometer" that tracks progress with *'s messes up redirected output:

lharc a lll file >log

it should be disabled if !isatty(1). zoo has no problem at all with stdout redirection to files.

- nitpicking: zoo lists files one per line. it is easier to grep things out for more specialized uses (like making lists of all .c files with their statistics).

- there is one version of zoo 2.1 (that i know of) for ST, unix, and PC. i stopped counting the versions of lharc for the ST alone at about 6 or 8. there is only one author of zoo.

- zoo 2.1 can extract files from ANY zoo archive of equal or lesser version. older versions of zoo can list any zoo archive even if made with a newer version. if a newer version is needed to extract files, the older zoo tells you what version you need. zoo 2.1 will also (by default) make archives which older versions of zoo will extract. you have to ask for the high compression algorithm specifically with the "h" command modifier.

- i can take the zoo 2.1 archive up to a unix (or VMS) system and extract the archive with no effort. i do not have to track down a version which will extract it. the original version posted to the net (source code) works fine. i have tried unlzhing an lh5 archive on unix with LHarc for unix v1.02 with no luck. it complains

that it cannot extract this method. in this case someone is going to berate me saying "well, you should get this_and_such version and quit moaning". i would (naturally) respond with "so how often do i have to update lharc on unix to remain current? i already have 2 versions. how many more do i need? i only need one version of zoo 2.1!". if it is any consolation, at least 1.02 does not core dump when it finds this out (0.03 does, at least my port on a convex does).

- neither program has a particularly consistent set of commandline switches. after years of use, however, i am at least used to zoo. and neither program as-is offers any particular advantage over the other from the desktop from what i can see. i never use the desktop so don't take my word for this. zoo does expand wildcards in file lists. i did not test lharc, fearing another system crash.

- comp.binaries.ibm.pc has used and continues to use zoo as its primary archiver for posted programs. it also uses zip and the occasional lharc file as well, however. now that zoo 2.1 is out, i see the use of lharc waning there. zip is still used.

i would compliment thomas on a fairly good program, at least a good improvement over early lharcs on the ST. he has done significant work to try and eliminate the inconsistencies between lharc versions. however, i just don't see a huge advantage in using lharc now that zoo 2.1 is available. and not getting the timestamp correct on extraction is very bad indeed. is there a bug fix for this or am i missing somthing here? and not handling long lists of files and crashing when presented with such a list is beyond unacceptable. note that if he had used C instead of assembler, especially GNU c, some of these problems would have been taken care of by the library. as it stands, he has to do this himself. consider this "user feedback" when you plan the next upgrade, thomas.

i confess that i did not read the docs for lharc. as far as i know the questor version docs have always been in german up until 2.01e which i just got within the past 2 weeks. but then again i did not read the docs for zoo 2.1 either. the only change in zoo 2.1 has been the "h" modifier for high compression and the "a//" addition for recursive directory searches so there was no need to read anything. both of these new features were mentioned in the README file. the rest functions as it always did. nothing new to learn. i already knew how to use zoo since i have used it for at least 2+ years.

i claim no authority in the use of lharc. i just ran it as i would zoo or arc or lharc on unix (the version i have, at least) like the dumb user i am. if these results can be bettered, please let me know how.

also, i know of some optimizations for zoo which may not have been applied in the version i have (posted to comp.binaries.atari.st by steve grimm). i know the unix version with larger i/o buffers is significantly faster (at least 20% on a convex C210 with VME disks). if that is also true on

the ST, then the small speed advantage lharc has (only on compression, that is) over zoo goes away. and zoo 2.1 may be even faster than lharc on extraction in that case.

i note that the speed difference in both test cases is 11 seconds during archive creation. it might be possible that this is a constant. if so, then doubling the amount of work will lower the net speed advantage to under 10%.

also note that this version of zoo appeared within days of being posted to alt.sources. i am sure it has not been tuned in the slightest. and i hope it stays that way, so we don't end up with 50 versions of zoo.

it would also be nice to look at each program's i/o efficiency by controlled tests in cluttered hard disk partitions or on virgin-formatted floppies. i have not done that nor do i think it is worth the effort at this point. also each program's handling of directory trees should be tested. zoo 2.1 (on the ST only!) now has an improved method for doing recursive hierarchies (a//). the unix version still uses the "find . -print | zoo aI archive" method as far as i know. this is not possible with the ST without CLIs that support pipes. gulam (and the desktop) do not support pipes.

believe it or not i have tried to be impartial. and the benchmarking process is not alien to me, tho i would not consider this a very thorough test. that would require a better set of "calibrated" test files (these do exist). i did not look at a set of files that were predominantly text, eventhough this is one of my heaviest uses (source archives). however, the files i chose were probably more indicative of the casual user's needs (programs with docs, and other archives).

i try to look past speed and size alone. these are not highest on my priority list for archivers, though they are important. i remember the very early versions of lharc which took EXTREMELY long times to compress. maybe 3-5 times longer than arc or zoo. this lharc is among the best, if not the best version of lharc, but it is far from being the best archiver overall, In My Humble Opinion....

comments??? rebuffs??? name calling???

> using was hosed or maybe (no it couldn't be!) i made some grievous error.

I'll bet the startup module you used doesn't support args, and you
were popping trash off the stack.

There's no real reason not to use the same startup module for both
GEM apps and straight .TOS/.TTP programs, unless you have some need
to save the few bytes required to parse the argument string into an
argv array.

Of course, the Alcyon GEM bindings might be missing some key
component (such as the crystal() function or the cntrl_cnts array for
the AES) that might be in the GEM startup file. If that's the case,
you'd need to add the relevant modules to the library. Ah, well,
Alcyon C is pretty well buried at this point anyway.

I've always used a single startup module for all Sozobon-compiled GEM
applications (except Desk Accessories, of course).

>
> GNU-tar? some type of uncompress program? maybe a utility that does
> them both?

It works just like Unix. First you uncompress. Then you untar.

atari/archivers/ includes:

compress.arc 40 Unix style compress.
compress.ttp 37 Unarc'ed compress for use with sounds, magazines, etc.
compress.zoo 68 Newer release of compress. Actually, bammi's version.
sttar.arc 20 Tar for the ST, unix style.
sttarsrc.arc 19 ST Tar source.

By the way, I haven't gotten responses to my last couple of mailings to
bart; is there a problem?

That was the case with Current Notes last time I saw an issue. It may
be different now. AtariUser is composed on a decent imagesetter.

>But I still can't find the Hidden screen!

I hate to spoil your fun, but the hidden screen is actually not accessible from the main menu. It is there, but you need to do some serious hacking to get to it.

By the way, Tim (Manikin) is now working on a game that features the fractal routs from the main menu, and when it works out, it is going to be good fun.

No longer $300us, as they now have a Hackers version for some $125 or was it $150us..

It would be nice if Atari would post some real info on this..

2978. 6809 cross assembler

Newsgroup: comp.sys.atari.st
Date: 1991-09-26 12:40:38 UTC
From: wvleeshh@wg.estec.nl
Message-ID: <1991Sep26.124038.8626@wg.estec.nl>
Source record: 228677

Anybody out there able to tell me if a crossassembler for 6809 exists and if so where can I find it?

Also the beast should be able to generate S1-S9 code.
Any help would be greatly appreciated!

All I did on my original 1040 to disable the leftover bank was clip the
L1 inductor which provides power to the chips. Worked like a charm, and I
could always solder it back together if I felt it was necessary. (Although WHY
I might want to go back to 2.5 meg from 4 meg is way beyond me.

you can use STTAR and COMPRESS, both avaiable from the a.a. Do a
'compress -d ' for decompression and then a 'untar'. That should
do ...

Hope this helps,

Larry

> (or something similar). If you have any problems, drop me a line and I'll
> upload you some fresh copies.
> jonathan brecher

The first one didn't quite fit my needs because I needed full
pointing. The second I found after being better than half way through
designing my own. It has full pointing, though it does it with zero
sized characters with negative offsets (I think). My screen display
software doesn't something about it. I decided I would only be
satisfied if I did my own, so I am completing it.

Those of you who wanted one too, can get one of the above, or wait
till I am finished with mine and I'll email it to you. It will
consist of 12, 18, 24 and 36 pt screen fonts (For Monochrome Atari ST

PageStream), the FM (font metrics) and DMF (dot-matrix font) files as well as a Type-3 postscript file and the PSF file for interfacing it to PageStream. My big goal is for it to look good at 12pt on a puny 300dpi printer. I suspect the other two would look much better at 1200dpi.

The way I am handling the overstriking is kerning pairs. There are two character widths for the consonants. All the vowel points (except holem, which is special because it goes in the corner instead of the center), are the same size as the small consanants. "We" would be a waw with a seghol under it. For the large consonants, a pad character must be added after the vowel to make up for its smaller size, hence "Be=". For holem, there is both a small (o) and a large (O) one. It must be put after the character to its left (BOY) would put a Holem between Beth and Yodh. Holem-waw is "w".

I have the basic set done, but I am still not happy with Aleph and a couple others, plus I still discover an occassional bug in my kerning (lots of pairs).

Hi there,

I need some good advice. I'm looking for a software which fits my needs and
can do the following actions:

- dial the number of a subnet node until the host answers

- my mails which are there should be packed and downloaded

- separated newsgroups should be packed and downloaded

- close the connection

- distribute the downloaded files in the correspondent directories,
unpack them

- show me a protocol what was going on

The software must run on a Atari TT030/6 and a Supra Modem 2400 plus.
I would prefer PD or shareware.

Bernhard

2989. New sound file formats proposals

Newsgroup: comp.sys.atari.st
Date: 1991-09-26 15:29:55 UTC
From: dba@jet.uk
Message-ID: <1991Sep26.152955.21311@jet.uk>
Source record: 228672

```
Hello atari neters

The recient posting to comp.sys.atari.st.binaries of nt_comp, a compiler
and module player program, included a wish by Klaus Pedersen for a new
format for sound files.

To open a discussion on this possibility.

The following is my personal wish list:
1. 8 channels with pan, fade etc on each channel
2. Quadraphonic output on STE with cartridge (MV16, Microdeal REPLAY etc )
3. Ability to mix or modify 8,12 and 16 bit samples
4. Change of frequency of samples 50KHZ, 44.1KHZ, etc

My proposals are:-

Proposal 1.
>The module file (*.MOD) is currently build this way :
>
>typedef struct
> { char mod_name[20];
> INST insts[31]; /* or 15 if a old module */
> char info[2]; /* info about repeat and nr of patterns */
> char seq[128]; /* the sequence table for the patterns */
> long id = 'M.K.' /* tells that this is a 31 voice module.*/
> PATT patts[n];
> char insts[m]; /* the samples for each instrument. */
> } MOD_FILE

I propose the following file format for ST soundModule files
(extension .STM):

typedef struct
{ LONG magic; /* magic number 'STM ' */
long version = 1; /* version number 1 */
char mod_name[20];
NINST insts[31]; /* could be 64 instruments ???? */
char info[2]; /* info about repeat and nr of patterns */
char seq[128]; /* the sequence table for the patterns */
NPATT patts[n];
char insts[m]; /* the samples for each instrument. */
} STM_FILE

Proposal 2.

>An Instrument is currently declared in a 30 byte descriptor:
>
```

```
>typedef struct
> { char name[22];
> UWORD length; /* offset to image of next instrument */
> UWORD volume;
> UWORD transient_p;
> UWORD loop_p;
> } INST
```

I propose an Instrument be declared in a 32 byte descriptor:

```
typedef struct
{ char name[22];
UWORD length; /* offset to image of next instrument */
UWORD volume;
UWORD transient_p;
UWORD loop_p;
word bit_per_samp; /* number of bits per sample 8,12,14 or 16
negative numbers for signed values
ie -8 signed 8 bit samples
12 unsigned 12 bit samples */
} NINST
```

This would allow easy conversion of sampled instruments and allow a full
16 bit or greater sample to be stored.

Proposal 3.

```
>Currently each entry in pattern holds information on all 4 channels. The
>information for each channel is held in one 32 bit word. (each entry
>is then 16 bytes long). The information has been put in entry this
>way:
>
> + + + + +
> xxx-i-xx-fffffffff-iiii-cccc-pppppppp *
> | | | | \______ parameter to command
> | | | \_____________ command
> | | \__________________ instrument (lsb's)
> | \____________________________ frequency (0-$400)
> \_____________________________________ msb of instrument nr.
> - the bits in a pattern entry.
>
>typedef long PAT_ENT; /* look about */
>
>typedef struct
> { PAT_ENT chanl0; /* NO way to make independent tracks! */
> PAT_ENT chanl1;
> PAT_ENT chanl2;
> PAT_ENT chanl3;
> } PATT;
```

I propose:

```
typedef struct
{ PAT_ENT chanl0; /* NO way to make independent tracks! */
PAT_ENT chanl1;
PAT_ENT chanl2;
PAT_ENT chanl3;
PAT_ENT chanl4;
PAT_ENT chanl5;
PAT_ENT chanl6;
PAT_ENT chanl7;
} NPATT;
```

>This is the reason I think that we should find a new format. I have a
>simple text based music language in mind. I should be possible to
>make small loops, for easy and trouble free rhythm tracks. And it
>should be possible to convert modules to this (more general)
>"language"...

This doesn't solve the above problem

>There are 3 ways to contact me:
>
>SNAIL MAIL EMAIL VOICE PHONE
>Klaus Pedersen micro@imada.dk 66 15 58 79

^^^^^^^^^
Not "of course". You can have a startup module that also deals with desk
accessories correctly (although I don't know if that uses undocumented
features, so it might not be legal).

2991. Upgrade - TOS => How?

Newsgroup: comp.sys.atari.st
Date: 1991-09-26 15:59:58 UTC
From: dinsmm@aix.rpi.edu
Message-ID: <v_yn7!f@rpi.edu>
Source record: 228670

I recently got a program that found out what version of TOS that I am using. I never bothered looking for it until now, and I found out that I have TOS v1.0 . Now, what can I do to upgrade this? My TOS is in ROM so will I have to buy a new chip, and if I do, where can I buy it?

Another question. I have seen a program called Icone, that is supposed to make icons for you, but I can;t get it to run. Anyone know how to use this program?

Thanks.

2992. TDI Modula2 News & Questions.

Newsgroup: comp.sys.atari.st
Date: 1991-09-26 16:15:36 UTC
From: chevalet@imag.fr
Message-ID: <26182@imag.imag.fr>

Hello atariens !

A friend and I are programming in Modula2 with the
good old TDI compiler.
We were tired of using the m2desk and he has rewritten
an improved version which will be soon avaliable as freeware
for all TDI users.

Just one thing is missing : we don't know which messages
the m2 accessory is able to respond in order to give
the current configuration of parameters (paths, for compiler
linker, etc) : does someone has theses specs ?

Last thing : is it true that TDI corp doesn't want
to update there (good) compiler ? is it true that they
even doesn't sell it ?

Really last thing : i'm wondering if somewhere someone is still
using this package ... except my friend and I !!

I salute you from France !!!

What I want to know is this: Does it have a cartridge ("dongle") port? I need
that port for my SMPTE/MIDI expander box (Unitor, from C-Lab).

If this is, in fact, one of the I/O's mentioned above, please inform me, for I
know not the technical terms.

What's the problem ? Is my price to high? This printer works
very well with spectre as well as atari applications.
Make me an offer.

For anyone using an ST its just great.

Atari SLM804 Laser Printer
This only has about 2100 pages printed
on it and has just had a new cartridge
put in it. $650
(Requires a least an ST with 2 meg of
memory or more.)

Terms are C.O.D. and the buyer must pay shipping.

send email or contact me directly.

A few days ago i have bought an Atari Mega STE 4. I have also seen this
screen shifting, but there were more problems!
First i have to say, that it original was an Mega STE 2. Now, first the high
2 MB doesn't respond correctly! So i have brought it back.
Now i have it again and there is only 1 MB responding!
I know that there are some dip switches inside to configurate the memory.
Does someone know how to adjust the dip switches for 4 MB?
Please e-mail me, because the server for my machine doesn't work well and so i
can't be sure if i can read news in the next time!

2. Question: Is there someone who knows something about a book for Mega STE's?
I know that Sybex will publish a book, but not till november!

For big name acts, how about Madonna on tour? The synth wizard apparently
runs around underneath the stage using Atari's running KCS (gag!).

The Pointer sisters use/d Atari.

Lee Ritenour, Dave Brubeck use Atari.

Donny Osmond uses Atari.

Several heavy metal acts use Atari, I can't remember them all, I think
Blue Oyster Cult is one.

Numerous top ten movies have soundtracks and effects done with Atari's
using ADAP, SmpteTrack, Notator, etc.

Anyone have any idea why the fantasia demo wouldn't recognise a June '91 STE
as an ste? Does it not recognise 1.62? Read it in the way that makes it think
it is 1.98? need it to be at 50htz. HELP!

This is the same old comapring prices in different continents thing. Is 4000DM expensive for a 10 hour battery-life notebook computer with a built-in GUI expensive in Germany? _I_ don't know.
